With the passage of the Apprenticeship Act of 1961, the GOI stepped actively into the field of on-the-job training as it specified that notified firms with craftsmen working in any of fourteen trades should admit at least one apprentice for every seven workers (the exact ratio varying with the trades concerned) in that trade other than those who are unskilled. This Act was later extended to include twelve other trades as indicated below.

Initial Coverages	Extended Coverages
1. Fitter	1. Plumber
2. Turner	2. Mill wright
3. Miller	3. Tool and die maker
4. Grinder	4. Instrument mechanic
5. Machinist	5. Refrigerator and air-conditioning mechanic
6. Sheet metal worker	6. Motor vehicle mechanic
7. Pattern maker	7. Diesel mechanic
8. Moulder	8. Tractor Mechanic
9. Blacksmith	9. Mechanic
10. Welder	10. Surveyor
11. Electrician	11. Draughtsman, civil
12. Linesman	12. Draughtsman, mechanical
13. Wireman	
14. Carpenter	

---

[1]The most meaningful costs for planning purposes would be costs per trainee employed in a craft utilizing his training, but these costs will have to be estimated from raw cost, enrollment, and completion of training data.

[2]See its recent report, p. 372. Many of those who enter the polytechnics then appear to use the polytechnics in turn as a springboard to the university, which is again dysfunctional.

Information that would be useful in coordinating this sector of the technical education plan with the other schemes would be estimates of the cost (implicit and explicit) of such apprentices to the industrialists, what happens to the apprentices after they complete their training, what kinds of personnel are taken on as apprentices and which of the three apprenticeschemes do they enter.[1] The possibility of using this technique for the development of other skills also needs to be considered in the light of the success in the above twenty-six programmes.

One of the consequences of the Apprenticeship Act giving the industrialists the option of whether to take on apprentices for the six month, eighteen month, or the thirty-six month course is that if they are not interested in employing many of their own apprentices, and are thereby interested in merely minimizing the cost of their statutory obligation, then all of the apprentices they would take on would be for the thirty-six month fresher course, for which their outlay per student would be minimized.

---

[1]According to the Directorate of Industries (Training), GWB, notification of 30th September, 1962,

. . . there will be three categories of apprentices according to the period of training:

(1) Six months' course: This will be a short term apprenticeship for candidates who have already completed 1½ years' training in any of the designated trades at an Industrial Training Institute/Center or any other Institution recognized by the National Council for Vocational Training. This short course is intended to be a substitute arrangement for the present course of in-plant training.

(2) Eighteen months' course: this will be the full term apprenticeship for candidates who have already completed 1½ years' Craftsman Training in one of the designated trades at an Industrial Training Institute/Center or an Institute recognized by the National Council for Vocational Training. In their case, credit is intended to be given for their eighteen months' institutional training in any of the designated trades.

(3) Three years' course: This will be the full term apprenticeship for freshers in designated trades . . . .

Syllabi for the apprenticeship courses:--

(a) The apprentices under the 3 Years' Course will receive basic training for the first six months and thereafter shop-floor training and related instruction during the rest of the period.

(b) The apprentices under 1½ years' course will not require any basic training, but will receive shop-floor training and related instruction throughout the course of training.

(c) The short term apprentices (6 months') will not be given any basic or related instruction since they have already completed 1½ years' institutional training in specific trades. In the workshops they will be given training in repetitive jobs only so as to acquire special skills in specific shops.

However, if the firm is concerned about employing as many skilled personnel as possible from its own courses, then it would stress the six month scheme, through which the output of trained apprentices is maximized. Thus, the output of students from the apprentice schemes for any particular firm will depend not upon the needs of the economy as a whole but rather upon its own expansion programme and the availability of ITI graduates in the market to fill positions in the six and eighteen month apprentice programmes.

I. D. TECHNICAL EDUCATION WITHIN GENERAL EDUCATION

Some technical education is conveyed to all students in general education curricula, and the nature of this training needs to be examined: What subject matter is covered? How thoroughly? At what cost? For how many students? How useful are the skills conveyed to the students? Are there other forms of technical training that might be more useful, such as enhanced mathematics or science programmes? Should all forms of secondary education entail some quota of manual training, such as carpentry, electricity, engine mechanics, and/or metal working?

I.E. OTHER IN-PLANT TRAINING

As the majority of the technical education in the CMD is currently conveyed on a very informal basis, and as this is undoubtedly the least expensive means of providing technical education--whether it is the most efficient or not is a moot point, and probably depends upon the trade concerned--some investigation into its effectiveness must be made. Interviews with educators, academicians, employers, and governmental personnel should include inquiries regarding the relative efficiency of those who have received the informal training relative to those who have received formal (e.g., ITI) instruction. On the grounds of these interviews and some a priori consideration of the problem,[1] some distribution of trainees between formal and informal training programme will have to be made.

I. F. THE FINANCING OF TECHNICAL EDUCATION

Estimates of the cost of technical education, not simply to the students, but to the economy, are crucial to enable decisions regarding the most effective training strategy. It may be that industry would be willing to undertake, for example, the training of larger numbers of apprentices, if they were paid something like the cost of their training in the ITIs. Such a shift might be a very effective means of providing closer links between industry and the training institutes, curriculum and current in-plant practices, and equipment in the technical schools and the technology of the plant.

---

[1]Problems such as external economies (a possible reason for governmental involvement) in the field of technical education will exist even if they cannot be dealt with quantitatively. A qualitiative assessment should be made simply to bring into open discussion such factors as the savings to employers as a result of subsidized training, the opportunity cost of technical education expenditures, and the reduction of wear and tear on machinery because of improved handling techniques acquired during instruction in the technical schools.

The cost data that would be useful in plan development would be training staff salaries, plant and equipment expenditures, cost of administrative overhead, raw material costs, hostel and student amenity expenditures, scholarships, etc. Hopefully, it would then be possible to compare these costs with those involved in the training of personnel in the plant, although the latter will probably be extremely difficult to assess.

I. G. THE ROLES OF INDUSTRY AND GOVERNMENT COMPARED

Following the collection and analysis of data in the above fields, it would be useful to compare the roles in technical education that are played by industry and government. What percentage of the trained personnel in industry were trained in governmental insitutions? What were the costs of training in governmental institutions relative to those in the private training programmes? Were the training programmes equally effective in skill development? Such information would provide some benchmarks from which to plan future training programmes.

I. H. LOCATION, SIZE AND LAND USE

Some consideration must be given to the location of the training institutions and their optimal size. While some training schools have in the past been located in rural areas and/or areas relatively removed from industry, this policy seems a bit dubious, and consideration must be given to the importance of factory visits, the ability of instructors to work part time in industry, the location and quality of post-training employment by area of training, the isolation of rural schools, the difficulty of enticing qualified staff to assume such positions, and the importance of the boys adjusting to the urban environment prior to their training so that they do not simply return to their village soon after employment because they found urban life too congested, noisy, and high pressured.

The size of the training facilities will also be important in the consideration of its location, unless hostel facilities are to be provided for the students. Size will also be important in at least one other consideration, that of the most efficient use of the institute's staff, plant, and equipment. If the school is too small, then it may mean that valuable equipment lies idle for long periods of time, whereas a larger student body would enable more intensive use of that equipment. On the other hand, a student body that is too large may mean that each student would then have too little time to work with the available equipment, that classes were too large to enable discussion, or that the complexities of administrating such a large organization overwhelmed the staff. The primary danger, however, particularly in a country or region concerned with regional and urban-rural imbalances, would be that of inefficiency arising from the former cause, that of the school being too small.

If a technical education plan is undertaken by CMPO, it should incorporate some estimates of land consumption that will be required in the plan: thus, data on technical training land use should be gathered which would provide a basis for proposals for future training facilities.

I. I. TEACHER TRAINING AND EQUIPMENT

Any data that is available on the quality of the instructional staff in the training institutions should be gathered and ordered. Difficulties in the utilization and procurement of such staff should be noted, and possibilities of breaking such bottlenecks should also be listed. If the staff of such institutions require opportunities for part time employment outside the schools, this is also an important consideration to place in the record. Some instructional staff members spend large portions of their time in the employ of industry, and the frequency of this occurrence, in conjunction with the quality of such staff relative to the quality of the full-time staff, is a consideration with great implications for the future structure of technical education, and should thereby be carefully investigated and analysed.

Considering the very important role that equipment must inevitably play in vocational and technical education, a plan for such training must give some consideration to its adequacy: are the tools used in training an adequate preparation for industry? Are the latest training techniques, such as the use of programmed instruction[1] being utilized? Is the equipment being used efficiently, or does it lie idle for long periods when, with a larger student body, it might be utilized more intensively? Is up-dating of the equipment a major problem? Can ways be found to use equipment in factories for training purposes during the factories' off hours?

I. J. THE SUPPLY AND DEMAND FOR TECHNICAL EDUCATION

Once all the information available on the production and employment of trained personnel is gathered, some attempt at a synthesis must be made. Is there considerable unemployment among the ITI graduates?[2]

---

[1]This technique, used widely in the West, has proven very effective in cutting training time, one estimate being that it reduces the time by two-thirds. For a discussion of the technique, see for example B.F. Skinner's article in various journals of psychology and education or Smith and Moore's book, Programmed Learning, Van Nostrand, 1961. For an example of its use in technical education, see the series by Coover and Helsel, Programmed Blueprint Reading, McGraw-Hill, 1963. Many programmed texts currently published could be improved for the Indian context by the addition of branching, elimination of superfluous paper consumption, and introduction of Indian languages, idioms and examples.

[2]Evidence in this area is very sketchy and evasive, for although the trainees may later be employed, they are not always employed in tasks using their skills developed during training. Often they fail to register with the employment exchange when they are unemployed, and many of those who are registered with the employment exchange are already employed. A Statesman article (17/5/66) noted that there were 5,000 unemployed ITI graduates in Bihar alone.

An affirmative answer would lead one to question the proposal of the Education Commission Report to more than double their numbers during the fourth plan. One test of the value industry places on the ITI programme would be to examine the income differential received by the students of the ITIs relative to those of the non-ITI employees. This differential could then be discounted over time and compared with the cost of their training to provide one index of the productivity of the investment in ITIs.[1]

It is conceivable, however, that industry would be unaware of the value of the training provided by the ITIs, and in this case, their willingness to increase such wages would be a poor index of the true value of such training. In any case, conversations with those in the field of hiring, firing, employing and training must be held to serve as a gauge for the assessment of whatever data is available. Finally, an appraisal will have to be made regarding the current situation in order to provide a benchmark for future programmes.

II. PROBLEMS IN GOVERNMENTAL SUPPORT OF TECHNICAL EDUCATION

II.A. HISTORICAL EVIDENCE

Historically, powerful countries have developed that have placed relatively small stress on the role of subsidized technical education and instead placed considerable importance on the value of strong primary and secondary systems. In the United States, for example, eighty per cent of the trained industrial laborers have received their training on-the-job rather than in technical schools, something like one-fifth of the skilled labour force have ever been in an apprenticeship programme, and probably only half of these finished their course. Training for skilled craft positions in West Germany is also characteristically carried out within the firm.[2] Even India herself has shown considerable industrial expansion in recent years in spite of the fact that most of her training programmes are carried out on an unsubsidised basis, and currently it seems to be shortages in the areas of capital, foreign exchange and raw materials rather than production process workers that constitute the predominant bottlenecks.

---

[1]The fact that some firms prefer ITI graduates to those who have not completed the ITI programme, does, of course, mean that the training imparted is of value to the firm, but it does not necessarily mean that the subsidy involved in their training is balanced by a proportional increase in their productivity on the job. In order for the subsidy to be worthwhile, the costs to the economy of their training must be offset by their increased productivity on-the-job.

[2]See the reports by the Spanish team which visited the Federal Republic of Germany (from 21st-27th June, 1964) to study Vocational Training and the international employer/worker team which visited the United States (from 13th-26th October, 1963) to study Occupational Preparation and Training and Regional Economic Re-development, both issued free of charge by the Organization for Economic Cooperation and Development. See also the joint AID and United States Department of Labour report on Manpower Programs and Planning in Economic Development, 1963.

Although the United States formerly relied relatively little upon formal subsidised technical education, recent congressional legislation has, however, placed increased emphasis upon it. This, however, should be recognized not as an indication of the fact that the U.S.A. feels it is a highly productive investment but rather that since the country is relatively affluent it can now afford to become concerned with areas of frictional unemployment, to subsidise their training or retraining, and tax the many to support the few who will benefit from this enlightened form of welfare. The fact that it is prudent for a relatively affluent nation with a shortage of skilled labour to subsidise the training of its unemployed does not mean that it is therefore prudent for a relatively poor country to embark on a widespread programme of subsidised technical education. Welfare measures in an affluent society are relatively cheap whereas they are relatively costly in a nation only recently entering the growth process.

II. B. DYSFUNCTIONALITY IN TECHNICAL EDUCATION

The formal technical education currently offered in India appears to have a sharp dysfunctionality between its aims and achievements. The Planning Commission[1] has reported, for example, that the junior technical schools not only have a high wastage rate but many of those passing out are able to avoid manual employment in skills utilising their training and instead rejoin the formal educational system in the pre-university courses or the polytechnics. There is some evidence that a high percentage of the polytechnics graduates also return to the educational stream and go on to the university. If such training is thus wasted, the prudence of expanding the system is called into question. The Director General of Employment and Training[2] reported that only two-thirds of the ex-trainees from ITIs covered in their survey were employed in trades utilising the skills they received in training. This raises the cost of employed ex-trainees by fifty per cent above the cost of what it would be if all were employed in trades using their ITI training.

II. C. TECHNICAL EDUCATION FOR SELF-EMPLOYMENT

Some people have argued that technical education should be expanded and the trainees encouraged to set up their own workshops and thus find employment through self-employment.[3] This argument appears a bit

---

[1]Factual Survey of Junior Technical Schools, New Delhi, 1964, paraphrased in the Report of the Education Commission, 1964-66, p. 372.

[2]Report on the Pilot Enquiry to Ascertain the Employment Status of Craftsmen Trained Under The Craftsman Training Scheme, 1963.

[3]See, for example, the Report of the Education Commission, 1964-66. p. 376. The cyclostyled report of the Directorate of Industries of the Government of West Bengal entitled "Note on Craftsmen Training Scheme and Its effect on Employment Position Prepared for the Lahiri Commission of Inquiry, West Bengal" states, "It has been seen that only a small number of passed-out trainees prefer to start their own industry in preferance to securing jobs in existing medium or large scale industries."

weak, however, and falls short at several points: first, most men establishing their own organizations have first gained experience through employment with other firms, thus, before they employ themselves, they must first become employed by another firm, and it is in finding this initial employment that the difficulty arises; second, self-employment requires considerable administrative knowhow plus capital, both of which are crucial bottleneck factors; and third, education, both general and technical, has historically bred organization men, and the experience in India does not appear unique.[1] Consequently, although it may in fact be possible to inculcate the entrepreneurial spirit in larger proportions of students than has been true in the past,[2] since the technology for developing the entrepreneurial spirit is still far from being either developed, tested, or an integral part of the Indian education system, to plan the expansion of the technical education system on the assumption that such trainees will find employment in their own shops appears a bit optimistic.

II. D. TRAINING AT AN EARLY AGE

The Report of the Education Commission 1964-66 has recommended that boys be encouraged to enter directly into the ITIs from their primary schools.[3] Considering the fact that these boys at this young age are still somewhat uncommitted to any occupation and resentful at having been screened off from the mainstream of education, thereby attending the technical school only with considerable reluctance, and considering that, as mentioned above, the junior technical schools already have a high wastage rate and send many of their ex-trainees back into the general education stream, there seems to be good evidence for a re-examination of the recommendation to lower the age of entry into the ITI. The minimal requirement for entry should be matriculation, so that the boy has the basic academic skills with which to utilise his training.

II. E. COSTS OF TECHNICAL EDUCATION

It has already been mentioned that the subsidised technical education provided through the ITIs is looked upon with some favour by industry, for in their hiring policies, they prefer the ITI trained applicant to the untrained. This, however, does not mean that the social investment in technical education is worth the social return to such outlays, it merely means that some training is better than no training. Whether the Rs. 4,500 spent on each graduate of the polytechnics is a productive investment remains to be seen, particularly when a large percentage of them return to the university. If fifty per cent of the polytechnic graduates returned to the university, it

---

[1]In the DGET report mentioned above, only two of 190 ex-ITI trainees were self-employed four years after their trade test.

[2]See, for example, the work by David Clarence McClelland, The Achieving Society, Princeton, N.J., Van Nostrand, 1961, in which he has attempted to isolate the factors in education responsible for the "achievement motivation" which is in part responsible, he feels, for economic development.

[3] P. 371.

would raise the cost of each polytechnic graduate returning to work[1] to Rs. 9,000, a considerable investment. Further investigation into (1) the actual costs (including a consideration of wastage) of training itself, (2) the relative efficiency of those trained on-the-job and those trained in formal technical education programmes prior to employment, and (3) the post-training activities (whether using their skills or not) of the trainees from various programmes will be vital in any evaluation of priorities for the technical training system.[2]

II. F. SUMMARY COMMENTS AND PRIORITIES

One experienced observer of manpower development in developing countries has levied these additional charges against formal technical education:

> Vocational school teachers should have industrial experience - yet typically the vocational school system simply cannot pay what it takes to hire industrially qualified technical personnel, who in addition are already pedagogues, from industry and into the school system . . . .
>
> The costs of vocational education are about double the costs of academic education. When you consider that the drop-out rate from vocational schools is uaually almost twice as high, the cost per "finisher" is almost four times as much. School systems ought not to waste their money on such dubious propositions . . . .
>
> Vocational schools tend to teach methods and machines either far in advance of those in actual industrial practice in the country, thanks to foreign machines and teaching methods having been brought in, or else they are far behind the practice of the country, if local resources have had to be depended upon to equip and run the school. It is rare indeed that a vocational high school can reproduce actual working conditions found in the industry of the country . . . .
>
> Training should be given as close to the specific job to be filled as is possible if the trainee is to develop the rhythm, specific discipline, and production tolerance of the specific job he is to fill. That cannot be done in the general training he receives in school . . . .
>
> Two boys, one of whom acquires his skill by training on the job, and the second by attendance at a vocational high school, simply cannot thereafter be set side by side to work together without creating a tough industrial relations problem for the employer.[3]

---

[1]Assuming that all of those who did not go to the university were able to find a job in a field in which they could utilise their skills developed in the polytechnic.

[2]See also section III. C. ii. "Returns to Technical Education."

[3]George Tobias, in a letter to the author dated September 29, 1966.

Clearly, then, there are very strong arguments that are raised in opposition to technical education.

There are, however, instances when the government may play a very important role in the promotion of technical education. One such situation is when there is a new area of technology that has not yet built up the hard core of technicians upon which the in-plant or on-the-job training programmes are built, such as air-conditioning maintenance men or non-ferrous welders. Another such instance is when a new technique has recently been developed that deserves rapid dissemination throughout the economy, such as the propagation of programmed instruction in the field of technical education.

Generally then, vocational education deserves to be subsidised principally when there are considerable external economies to be gained by so doing, crucial bottlenecks that must be broken, or new techniques that deserve rapid injection into the labour force. If subsidy is undertaken, then it should be done with care that the instruction is in the techniques currently utilised by industry or those which may be assimilated by industry using its current technological structure. Instructors must be qualified; students must be old enough to appreciate the subject matter and the necessity of its absorption; and the equipment utilised for demonstration and practice by the students must be similar to that they will encounter in their own workshops or offices.

III. THE FUTURE OF TECHNICAL EDUCATION

III. A. EMPLOYMENT TARGETS

Employment projections by industry and occupation will be essential for the development of a comprehensive technical education plan. The projections will be filled with complications and uncertainties, but estimates, in this case, are better than no estimates, assuming the former are not used as a facade for irrational policy proposals. The weaknesses of the projections should be underscored by their architect, and their policy implications drawn only with caution.

The problems to be dealt with in the projections will include the following: What will be the impact upon the economy's expansion of foreign competition? How rapidly will new technology replace formerly labour intensive production systems? How rapidly will new technology create new types of employment, such as in business services, data processing, air-conditioning, transportation and communications? What kinds of new skills will be called for in the future economy of Calcutta? What kinds of occupational shifts within industry will take place as a result of technological change? These and other questions will be dealt with either implicitly or explicitly in formulating an employment projection that would be imperative in a manpower strategy.

III. B. MANPOWER REQUIREMENTS

When assessing the manpower necessary to fulfill the employment projection, the occupational descriptions should include the minimum formal education required for efficient job performance along with

alternative means of meeting the technical training requirements of the position. In other words, the requirements for fitters might be expressed as, say, matric plus (a) ITI certificate plus six months on the job, or (b) two years on the job plus evening courses three times a week (which should also be described), or(c) three years on the job. By so expressing the manpower requirements, one does not preclude flexibility in development of the technical education plan through the elimination of choice between training programmes.

In developing a complete manpower planning programme, one would attempt to do this for all categories of industries and occupations, but as this plan is for technical education, the occupations dealt with should be only those requiring some form of technical education, either formal or on-the-job following some minimal level of education. The important questions for such an investigation would then be along these lines: What is the minimal level of formal and general education required by a fitter for the efficient performance of his job? What are the different ways in which the fitter may receive the technical education necessary for his craft? How much of this technical education may be given in a formal technical training institution, and how much of it may be given to him on-the-job?

In order to conserve time and effort critical areas for training support could be isolated and analysed rather than all of the above categories. Such vital areas, as suggested earlier, might be those industries or skills which have only recently been introduced into the economy, such as aluminium welding and/or those areas which are particularly critical in terms of coordinated and efficient plant operation, such as the training of supervisors and overseers in the polytechnics. For academic thoroughness, one is tempted to study all of the occupations and industries, but in order to hit the crucial bottlenecks with the minimal resources available, one should concentrate on those areas with the most binding shortage. These shortages can be assessed by investigating new growth sectors and new occupations within old but important industires.

III. C. THE STRATEGY FOR SUBSIDISED TECHNICAL EDUCATION

III. C.I. THE CLIMATE FOR TECHNICAL TRAINING

One of the most important factors in the encouragement of technological expansion is the creation of a climate amenable to the development of technical craftsmen. This climate envelops many factors, ranging from the legal to the psychological. The structure of relative wages must be such as to encourage the competent to follow through in the development of their skills. Attitudes towards manual labour must change so that it becomes increasingly respectable to work with ones hands, so that boys who currently aspire merely to "sit under a fan," as one technical education official in Calcutta has so aptly expressed it, will be encouraged to take pride in their ability to operate a turret lathe or maintain an internal combusion engine. This social stigma on manual vocations has even received legal sanction:

> In Bombay the law stipulates that no one who has passed the matriculation examination may be kept in a manual job. At the municipal transport yard where my Brahmin acquaintance showed me around and told me about his problems with Scheduled Caste drivers, he pointed out one young man in a white shirt tabulating records on a long white sheet. He had become a pretty good man on the motors, he told me, but he also went to school and when he passed the matric, they had to make him a clerk.[1]

Until this frame of reference is changed, the encouragement of technical education and vocations will fall on deaf ears, who will accept such training and employment only when all other doors, save unskilled labour, are closed to them.

Another important aspect of the climate for technical education pertains to social mobility. Is admission to the technical institutes de facto exclusive of certain members of the society, or does the percentage distribution of trainees by caste, language, religion or place of birth correspond to the percentages existent in the society as a whole? Is employment in certain trades exclusive of certain groups or does the distribtuion of labourers within each trade correspond to that of the entire community? If the distributions differ significantly, what are the causes of the differences and the implications for policy? These considerations should not be overlooked, for inefficiencies may exist within the respective trades, arising out of their monopolistic positions, the goals of equality of social and economic opportunity may be seriously violated, and the cost of training per employee using his skill received in training may be unnecessarily high as a result of restricted entry into the occupation.

III. C.II. RETURNS TO TECHNICAL EDUCATION

Yet Calcutta is not alone in the dilemma of technical training, for a recent survey of the literature in the field of technical education concluded that not only is the return to investment in technical education less than the return earned by other educational forms, the return to technical education has been negative.[2] While the precision of such calculations leaves much to be desired, there are, as has already been indicated, many grounds for criticising orthodox forms of formal pre-employment technical or craft training, and not the least powerful of these criticisms is that it is terribly costly relative to its returns.

Ghana is another country encountering throes of growth and employment somewhat similar to those of India:

---

[1]Harold R. Isaacs, India's Ex-Untouchables, Bombay, Asia Publishing House, 1965, p. 95.

[2]See the article by Mary Jane Bowman in the March 1966 issue of The Sociology of Education.

> In virtually every African territory there appears to be a current stress upon the need for the provision of technical education upon a massive scale to meet the "needs" of the economy. Sometimes such demands are based upon the conslusions of manpower surveys, the source of whose projections may not be too clear. Yet a sober inspection of the actual structure of job opportunities within an economy such as that of Ghana gives no reason to suppose that the products of technical schools can be absorbed soon on a large scale.[1]

Pakinstan has found investment in secondary level technical training constitutes an unwarranted diffusion of its educational energy and decided to concentrate on high quality general secondary education:

> The secondary school system should not be relied (sic) to train pupils for specific occupations in agriculture, business, industry or government. Its role in relation to vocational education should be to prepare boys and girls in the knowledge and skills which will widen their opportunities for more particularised vocational or professional training, in special or higher institutions, or in employment . . . . The best educational process for training in an occupation is "learning by doing it on the job." Moreover, any expectation that the school system should provide skilled specialists for the innumerable types of work in industry, business, commerce, government and agriculture would mean an intolerable economic and curriculum burden. The schools can and should provide a solid basis for specialised training by educating pupils in principles, by assisting them to reach mental and manual maturity, and by providing them with information and guidance concerning opportunities in various occupations. Secondary schools cannot be expected to sacrifice their essential objectives to the narrow training required for specific occupations.[2]

These two countries have found, as have other developing nations[3] that investment in vocational training at the secondary level yields a very low rate of return. This, however, does not mean that India and Calcutta should therefore avoid all forms of technical education, but rather that it should be very selective in such investments.

---

[1]See the excellent article by Philip J. Foster, "The Vocational School Fallacy in Development Planning," p. 148, in C.A. Anderson and Mary Jean Bowman (eds.), Education and Economic Development, London, Frank Cass, 1966, 436 pp.

[2]National Planning Board, Government of Pakistan, The First Five Year Plan: 1955-60, Karachi, 1958, p.550, quoted in Frederick Harbison and Charles A. Myers, Education, Manpower, and Economic Growth, London. McGraw-Hill, 1964, p. 96.

[3]See also, Harbison and Myers, Manpower and Education: Country Studies in Economic Development, London, McGraw-Hill, 1965.

The high costs of ITIs, junior technical schools, and polytechnics have already been referred to above along with mention of the tendency for their former trainees to rejoin the general education stream. Considering the cost and the difficulties their graduates encounter procuring jobs, the Education Commission's proposals to strengthen and expand these programmes seem to warrant a careful re-examination.

III. C. III. JUNIOR TECHNICAL SCHOOLS AND THE ITI's

Considering the fact that both the ITI's and the junior technical schools are designed to prepare skilled production process workers for their future occupations, one wonders why two separate forms of instruction have been established to perform the same job. As entry into the ITIs requires matriculation and entry into the junior technical schools requires merely an eighth class pass, who is still quite young and occupationally uncommitted. While the author would support expansion of the ITIs only with reluctance, and only then in areas of proven shortages of new skills and technologies, this policy would seem more sound than similar investment in junior technical schools.

III. C. IV. IMPORTANCE OF A SOUND GENERAL SECONDARY EDUCATION

As the vast majority of skilled labour is actually trained on the job through informal techniques, the most prudent investment in a skilled labour force would seem to be a well-balanced and high quality general secondary education system that would provide the essenial mathematics, language (especially English, German, Russian or French), and scientific skills to all of the labour force.[1] The primary danger in technical education at this early age is that of over-specialisation prior to employment which makes it extremely difficult to place the student following the completion of his training. This emphasis upon a sound general secondary education with an emphasis on math and the sciences will be especially important as the aversion of people to manual occupations is gradually broken down by changes in the wage structure and acceptance of the modern technology.

III. C. V. AN EXTERNAL EXAMINATION SYSTEM

The possibility for an employee to further his education following his employment should be strengthened, perhaps through the establishment of an equivalent, at the crafts level, to the University of London's external degree system, whereby anyone may subject himself to an examination of both his theoretical and practical skills in any of several fields, the successful passing of which would entitle him to a certification of having met the minimum standards for the craft of skill. These tests could be given in any or all of the relevant fields, from

---

[1]The high cost of this "high quality" instruction should not be the source of savings within the educational system, but should provide all of the tools now available, including audio-visual aids (radio and television, when available), trained instructors, study visits to factories and community institutions, the latest textbooks - which should include programmed instruction tests as referred to above in sec. II - and a reasonable amount of equipment for science courses. Any economies or cuts in expenditures within secondary education should be in terms of quantity rather than quality.

stenography and accounting to inventory management and machine tool operation. The establishment of such an examination system would make it possible for the employees to seek education on their own and in the evening to develop their skills on their own time. This examination system would not only save the government the revenue involved in the development of such skills, but it would also provide constructive channels for the energy and determination of the ambitious. This examination system would encourage private enterprise to enter the technical education field, and it may even be that supervisors and other employed skilled personnel would establish their own tutoring programmes in the evenings to supplement their incomes, or they might be employed by small, private training schools to teach a course or two in the evening. This would be a means of rewarding those who are ambitious, already employed and willing to pass on their skills to others equally endowed with ambition during their off hours.

III. C. VI. AUXILIARY COURSES

The training system should be augmented by the provision and support of short courses, auxillary training programmes, and sandwich courses which cater to the needs of employers and employees already committed to particular jobs or production processes. When the courses require that the trainees become familiar with particular types of equipment, the equipment used for training might be the same equipment as that used on the production line, but the training might take place during the hours when the production line is not in operation, such as the weekend, early morning or evening hours.[1] These courses would be a natural complement to the external examination system proposed above.

Where the information system indicated a severe shortage of personnel, government might profitably decide to subsidise such training programmes. The benefits of utilising the equipment in place in the plant would be that the students would thereby be trained in the current technology, with which they would have to be familiar after employment. If the supervisors or operatives from the plant were given a supplement to their income for providing the instruction in equipment operation, and if the industry were well paid for the use of its equipment during the off hours, such a proposal seems a reasonable means of training as well as providing competent instruction on up-to-date equipment.[2]

---

[1]This proposal would obviously be inapplicable where the production process is a continuous one and a stoppage of the flow would require the shutdown of all operations and a gradual re-starting of the flow, as would be true in chemical or fertilizer plant operations.

[2]For a more detailed discussion of this point, see Appendix I, "A Note on Rigidity in Technical Education."

III. C. VII. GOVERNMENT SUBSIDY FOR INDUSTRY MANAGED TRAINING

Another one of the difficulties in technical and vocational training, that of coordinating the interests of industry with the administration by government, has been dealt with in France through their Vocational Training Institute.[1] This institute, from which India might learn a lesson, is financed almost entirely by governmental subsidy with the exception of some support by employers, employees, and firms for the wages of trainees and instructors during the periods in which they are involved in training. The governing body of the institution is a board of directors made up of six representatives each from government, trade unions, and employers, with subcommittees which deal with the specific problems of the individual vocational areas. The primary advantages of this system are that industry is strongly in favour of it and willing to grant leave to employees to enter the courses, instructors are paid wages competitive with those in industry, industry supplies some skilled labour to work as instructors in the institutes, and that the quality of instruction must be of a sufficiently high level, or industry would not be willing to pay part of the salaries of their employees while they undertake such training. If government feels that it should play a strong role in the provision of technical training, such an administrative structure, with appropriate modification for the Indian setting, would seem to insure that the training so subisdised would be of high quality and consistent with the interests of industry. It could easily be argued that the entire control of such an institution be placed in the hands of industry[2] with the proviso that its activities would be subject to annual review by government, say through the All-India Council for Technical Education and/or the National Council for Vocational Training. The Institute of Jute Technology in Calcutta and the Ahmedabad Textile Industry's Research Association are existing examples of governmental-industrial cooperation in training, and possibilities for further cooperation must not be overlooked.

The main reasons for such a joint training effort combining governmental finance and review with industrial management are that, first, when the government operates such training institutions, they are usually subject to the criticism by industry that the types of skills and the level of their development are out of line with the requirements of industry; second, when industry alone is responsible for such training it may fail to produce a sufficient number of trained personnel

---

[1]See Appendix II, "The Report by the Austrian trade union team which visited France from 28th-31st October 1963, to study Vocational Training," OECD, Social Affairs Division, Programme for Employers and Unions, National Missions 1963 - Report No. 6.

[2]Technical training for engineering crafts may be placed in the hands of the Indian Engineering Association and/or other engineering associations.

to take advantage of the potential external economies[1] that exist in the field of training; third, the single firm operating in isolation may not be large enough to keep abreast of the latest training techniques; and fourth, the industry currently may be too disorganised to cooperate effectively on the establishment and maintenance of an up-to-date technical training system. As a partial guarantee that the training administered by industry and financed by government is actually required by industry and not simply a way to increase the number of skilled craftsmen in order to bring down the wage rate of such craftsmen, government might well require that industry finance some portion of the training.[2]

Two very important aspects of a technical education plan are, first, the establishment of an information system that will reflect current and potential shortages and surpluses of skilled labour and, second, the construction of administrative procedures that will automatically adjust the training programme to meet the changing structure of shortages and surpluses. If the responsibility for changes in the types of skills to be developed remains in the hands of industry, it means that the power to make the institutional changes would lie with the potential beneficiary of the changes - rather than industry having to persuade government that such alterations would be beneficial - and consequently, the likelihood of the proposed change being implemented is enhanced. The devolution of administrative authority into the hands of industry would also mean that if the quality of training declined below that required, industry itself would have the responsibility for raising the standards. Such an administrative structure for technical education would mean that industry rather than government itself would be

---

[1]External economies: Cost advantages which accrue to the firm as a result of activities beyond the control of the firm, such as the creation of a supply of skilled manpower through the ITIs; internal economies: those savings that accrue to the firm as a result of activities within its control.

[2]West Germany's technical education system is also worth some study, for here technical training is characteristically within the firm, and the Central Bureau for Industrial Vocational Training (Arbeitestelle fur Betriebliche Berufsausbildung) in Bonn, which is the "nerve center" of Germany's vocational training programme, is not an official body but holds the "patronage of the three important bodies", the Federation of Chambers of Industry and Trade, the Federation of German Industries, and the Association of German Employers. This Bureau holds the responsibility for the planning of courses, determination of levels, and formulation of terms of agreement between the trainees, the school and the firm. See the Report by the Spanish team which visited the Federal Republic of Germany, from 21st-27th June 1964, to study "Vocational Training," OECD, Social Affairs Division, Programme for Employers and Unions, National Missions 1964 - Report No. 5, Paris, 34 pp.

responsible for breaking the rigidities of institutionalised technical education. Government, with less to gain from flexibility, would be correspondingly less likely to pursue such a policy.

Another scheme - which would be devised in an attempt to compensate firms only for those training costs from which the benefits would accrue to firms other than the ones providing the training - might be to compensate firms for all technical personnel whom they originally hired as unskilled labour and who, following training and up-grading within the firm, later leave the firm to take up a position as skilled labour with another firm. The amount of the compensation should be inversely proportional to the employee's length of employment as a skilled labourer with the original firm in order to deduct for depreciation of training costs and benefits already earned from the training by the firm imparting the training. Such a scheme would mean that industry would be compensated only when personnel left a firm after receiving training in the firm and thus would receive no compensation for those whose productivity is beneficial only to the firm which provided the training. Firms would not be compensated for training of their own staff, so long as they kept their staff, nor would they be compensated for departed skilled labour when that labourer was skilled prior to employment. Consequently, those firms who were net suppliers of skilled manpower to the economy would be compensated accordingly.

Once the administrative machinery for training is developed, it will be important that the training conducted is done as efficiently as possible, with the latest techniques for instruction, utilising up-to-date textbooks, audio-visual aids, and programmed instructional materials.[1] Government should see to it that such up-to-date teaching materials are available to trainers in both public and private organisations.

Much of the training should be given through the media of evening, sandwich, and part-time courses, - for reasons which have been given earlier - although there will probably be a continuing need and/or demand for full time programmes as well. The greater the burden that industry is willing to shoulder, the more resources government will have for roads, utilities and formal education, all of which are equally vital in a viable economy.

IV. IMPLICATIONS FOR POLICY

IV. A. THE IMMEDIATE FUTURE

The immediate steps to be taken in the process of planning for technical education should concentrate on an assessment of the process and efficiency of the current technical education system. This would include a good number of interviews with small as well as large firms,

---

[1]See section I.I.

industrial associations (Indian Engineering Association, Indian Chemical Manufacturing Association, etc.), chambers of commerce and industry, ITIs, the CTI in Dasnagar, the Employment Exchange, the National Sample Survey, the Indian Statistical Institute, and the Census of India. Questions which would be asked of these organisations would be along these lines: How well is the current technical education system working? Are there blatant skill shortages that are not being met by the system? Has the system produced an excess of any skill categories? Is the quality of training provided consistent with the time and money invested in the institutes? What additions to or changes in the current system would you propose? What are the shortage areas in the skilled labour market? To which of these should the governmentally controlled training system direct its activities? What do you think of our recommendations for improving the training system?

The interviews with the ITIs and CTI might attempt to discover the means through which they adjust to shifts in the supply and demand for various skill categories, the rapidity with which their graduates are able to find employment following completion of the curriculum, and the means through which they attempt to keep their technology up to date and their instructors familiar with the latest technique. Some study of their costs and salaries would also be useful.

The Indian Statistical Institute, the Census, the National Sample Survey, and the Employment Exchanges should be contacted principally to consider the problems of developing an information system that would depict fairly readily the labour shortage and surplus areas. Interviews with other organisations should then seek to discover means of connecting this information system to the training system so as to facilitate rapid adjustment to changes in the supply and demand for various skills. The effectiveness of the supervisors of the Directorate of Industries in assessing the demands for skilled personnel should also be examined.

Another important part of the first stage of a work programme would be for the personnel to become as familiar as possible with the literature in the field of manpower development and technical training. This survey would include the OECD literature in the field of manpower and educational development,[1] John Vaizey's Economics of Education, P. J. Foster's excellent article on "The Vocational School Fallacy . . ."[2], Harbison and Myers' Education, Manpower, and Economic Growth, Adam Curle's Educational Strategy for Developing Societies, and Stephen F. Cotgrove's Technical Education and Social Change.

---

[1]A complete bibliography of the OECD literature is to be found in the latest issue of the OECD Observer, the organisations quarterly journal, issued free of charge to technical agencies in developing countries.

[2]Referred to above.

IV. B. AFTER THE SURVEY: PHASE TWO

Following the preliminary survey described above, the analysis should begin to grasp the nature of the training system, its strengths and its weaknesses. At this stage then, the data and information accumulated should be synthesised and from the synthesis should come some tentative proposals regarding shortages and surpluses in skilled manpower, techniques for building in more flexibility into the training system, and possible changes necessary in the current organisation for technical education. These proposals should, of course, be discussed in second phase interviews with employer representatives as well as those currently involved in technical education. From these discussions, then, should come hardened proposals, either to keep hands off the system, as it is already quite satisfactory, or to change the system according to a detailed programme.

IV. C. THE LONG RUN: PHASE THREE

The long-run planning for technical education should seek to develop an information system which will be sensitive to shifts in the supply of and demand for skilled manpower. Then the plan should structure the administration of technical education so that institutional rigidities will be minimised and sensitivity to changes in the manpower market reflected by the manpower information system will be maximised. One index of the latter, for example, which might well be examined, would be to study the correlation between the shortages as reflected in the employment exchanges and the adjustment of the ITIs and apprenticeship system to meet these shortages.

The need for long-run detailed projections of the demand for skilled manpower is minimised by the length of time necessary to train such manpower given the availability of men with a sound secondary education. Given well grounded secondary school leavers, the maximum time necessary for training such men into skilled craftsmen should be no longer than two or three years, depending upon their vocation. This assumes, of course, the availability of instructors and equipment necessary to impart the training. Consequently, the important considerations for the technical training system are that it have a pool of well educated secondary school leavers, be sensitive to changes in the supply and demand for craftsmen, and that it have built into it flexibility in terms of plant, equipment, and instructors.

That the technical education plan must be closely geared to the overall economic development programme is axiomatic. The employment projections for the technical education plan must be the same as those upon which the population trends are based, and the demand for skills must be based on the best estimates of technological change. Fortunately, however, as indicated above, the detailed projections for skilled personnel will not have to be made more than five or so years in advance, for that would be sufficient to enable changes in or expansion of the output of the various skills. Unfortunately, on the other hand, considerable technological change may take place within a period of five years, and so the planners will have to keep their ears well tuned to the technological shifts likely to displace their trainees.

The long run would be the period for the implementation of agreed upon proposals for changing the technical education system. These proposals may be worked out jointly with the Department of Commerce and Industries and/or with the Education Department. It may be that proposals will arise which should be aimed directly at the Government of India, such as a University of Delhi equivalent to the University of London external examination system which would cover vocational and technical skills as well as university subjects.

Only in the long run will the appraisal of certain proposals be possible. For example, it would only be over the long run that the market would be able to develop techniques for utilising the external degree system for the production of skills. Only over a period of time would private technical schools and training programmes arise to meet this increased demand for training, and to appraise such a proposal too quickly after its implementation would be a flagrant miscalculation.

The long-run work programme for technical education would also have to consider some of the more detailed calculations that would be useful for making the marginal decisions necessary for the enhanced efficiency of the system. Improved data on costs, salaries, employment and trainees should be developed and made increasingly available to the planners. Technical education planning will gradually become more closely linked with overall educational and manpower planning as the society gradually upgrades its skills and as the instructors for the operatives increasingly hold higher and higher academic qualifications. In fact, employment projections for the next couple decades will also depend upon the availability of higher level manpower, for as such talent proves a bottleneck on the economy, they also prove a ceiling on the quantity of operatives that must be trained. The same is, of course, also true of other inputs into the system, for, indeed, as any essential resource becomes a shortage commodity and blockage to production, it likewise provides a maximum for the demand for trained production process workers.

R. C. Young
January 19, 1967

APPENDIX I
A NOTE ON RIGIDITY IN TECHNICAL EDUCATION

THE PROBLEM:

Rigidity in technical education may be found in several forms: instructors who are unfamiliar with the latest technology; machinery that is out of date; curricula that have little relation to in-plant operations, and the inability of the system to adjust to changes in the priorities for training arising from changes in the supply and demand for technical personnel, to name four. This note attempts to open discussions on new means of attacking these rigidities within the constraints of India's economy.

One of the very high costs involved in the establishment of a technical training institution involves the purchase of expensive machinery on which the trainees will be trained. One of the reasons that this machinery is expensive is that its opportunity cost is the productivity of that machine in the manufacturing process. An investment by the technical school thus incurs a very high fixed cost, which, in the event of a change in technology would mean that either it would have to sell such machinery (at a considerable discount, in the face of another more advanced technology) and purchase new machinery or it would have to continue using the out-dated machinery at the high cost of training its students in an out-dated technique.

A similar long-term technological commitment, though somewhat less rigid, takes place when an instructor, trained in the latest technology, is hired by a technical institute. In the first place, the fact that the insitute is able to afford the instructor may mean any of several things: that the instructor is incompetent, unable to get a job in industry and therefore willing to take up a low-paying teaching position; that the institute can afford to hire competent personnel as instructors, who would otherwise take high paying positions with industry as a supervisor, because the institute is very wealthy (a happy but rather uncommon circumstance for technical training schools in developing countries); or else, the highly skilled instructor is willing to accept low wages paid by the training school because he is highly devoted to industrial training in his country (likewise, a happy occasional but rather uncommon occurrence in developing nations). Assuming that the technical school is able to hire staff fully familiar with the technology current at the time of their employment, five or ten years later, the technology of the industry may have changed considerably while that original and formerly up-to-date staff is still in the employ of the technical school. If the technical schools were to dismiss their staff members every ten years as technology changed, this would mean recruitment of new staff members would take on new difficulties, for few men like to take a position knowing that, even if they like the job and do well in it, they are doomed to dismissal in five to ten years.

Another aspect of the rigidity problem is that the excess of demand over supply of certain types of skilled personnel may only be ephemeral; that is, it may be that after a certain number of such personnel have been trained through special training programmes, the excess of demand over supply for such personnel, which technical institutes are designed to meet, may disappear, leaving the technical training authorities with idle instructors and equipment for such training. The establishment of traditional training institutions is able to meet such ephemeral shifts in demand and supply for technical personnel only at very high cost.

SOME COMMENTS ON SOLVING THE PROBLEM:

One of the prominent features of India's economy is the underutilization of her plant and equipment. This has been pointed out by many analysis and must not be forgotten when one is developing a system of technical education. Given this underutilization of industry's own plant and equipment, one might then ask, why should the country continue to invest in such technical institutions when capital is already standing idle (for certain hours of the day and week) during the off hours of the production line? Why not make arrangements for the technical trainees to use industry's idle equipment during the off hours of the production line?

If the equipment of certain plants is not utilized until, say, eight o'clock in the morning, then why not arrange for the technical trainees to be taught on the equipment from, say, five or six o'clock until eight o'clock? Or from seven till nine in the evening? The rest of their technical training, which will often consist of courses such as introductory physics, metals, chemistry, labour relations, etc., and which would not require the use of machinery (with the exception, perhaps, of laboratory equipment), might then be carried on elsewhere under normal class room situations.

Most industries will, of course, be very reluctant to allow a group of unskilled men, with instructors who may leave a good bit to be desired, to come into their plant to receive their training. Considering the fact that a group of improperly supervised students could do considerable damage to the equipment, impair the operations of the production line, and raise the costs of normal operation, such a plan would be looked upon with considerable scepticism.

Suppose, however, that the government were to approach the industrialists with a plan which would mean that the training were to be conducted by their own supervisors and would mean that the manufacturer would be reimbursed in cash for the use of his machinery and his personnel. Current supervisors might be encouraged to participate in the programme through wage bonuses for serving during either the early morning hours or the late evening hours. As only part of their day, perhaps two or three hours of their eight hour day, would be given over to the formal technical education programme, they could still carry on in their former capacity for say, five of their eight hours and delegate their responsibilities to other supervisors during their absence, which would be only two or three hours per day. It clearly would mean that all resources, both the human and the physical capital of the firm, would be utilized more intensively than is now the case, but if training in the most up-to-date techniques and with the most capable personnel is truly an imperative for the economic development of the region, then this is one possibility which might be considered to resolve the problem of rigidities in both equipment and personnel.

The managerial aspects of such an approach to institutional rigidity must not be slighted; they will be of not inconsiderable difficulty. First, there is the problem of determining which skills require augmentation

through government involvement in the training process, and in this problem, the National Employment Service and industrial associations should be quite helpful. Second, there is the problem of encouraging supervisors to work during other than their customary hours; however, considering the willingness of personnel to "moonlight," or hold more than one job, this does not seem an insuperable barrier to the programme. The government could afford to pay him slightly more per hour than he would otherwise receive because of the fact that the government was saving money through a reduction of their fixed costs. Third, there is the problem of compensation to the company for the use of their plant and equipment for the training programme. Theoretically, the government should be willing to pay the company up to the depreciation charges on the plant and equipment that the government would otherwise have to purchase in order to provide such facilities to their trainees. And still other difficulties will become apparent if such a proposal is broached to industry. This technique could, of course, be applied to other skills, such as card punching in automatic data processing, typing, private branch exchange telephone operations, etc.

Clearly such a proposal is not foolproof, but neither is the current rigid and oft criticised system of technical education, with its outdated machinery, ill-equipped instructors, and lack of coordination between the trainers and employers. Improvements in the current system are sorely needed, and it is hoped that proposals better than this paper are about to be unfolded. Until they are, however, these proposals at least seem worthy of initial consideration.

APPENDIX II

REPORT BY
the Austrian trade union team
which visited France
from 28th-31st October, 1963
to study
Vocational Training

I. General

The purpose of this mission was to study accelerated vocational training in France, where there is a particularly advanced system of training, re-training and advanced training for adults, both from the point of view of organisation and teaching methods.

The programme prepared for the team began with general talks at the Ministry of Labour and included detailed discussions at the Head Offices of the Vocational Training Institute, at Champs-sur-Marne near Paris, and visits to the French trade unions, G.G.T.-Force-Ouvriere, the C.F.T.C. and the C.G.C.

II. The System of Accelerated Vocational Training in France

1. History

Accelerated vocational training was instituted in France during the post-war period, in order to make up for the lack of skilled workers, particularly in the iron and steel building industries. Later, the emphasis was changed from initial training to supplementary training (1959 Law on the Advancement of the Labour Force) aimed at adapting workers, who were already trained, to changed technical conditions. 328,000 workers have undergone training since 1946. Up till now, 25,000 workers per year have undergone training courses, and the number will shortly be increased to 40,000.

2. Types of Training

A basic distinction is made between first and second grade training. The purpose of first grade training is to prepare skilled workers for the various branches of industry. Second grade training provided supplementary training for highly skilled workers, such as technicians, chemists, draughtsmen, etc. Special attention is paid to the training of the disabled.

3. Trades

Training is at present provided for 172 trades which are mainly in the iron and steel, chemical, textiles and building industries but also for office employment (shorthand typists, etc.). Training requirements are based on the long-term employment forecasts which are made in France; these are broken down by trades and regions, but of course give only general information as to future requirements of labour.

4. Administration

Whereas education in France, both in ordinary schools and trade schools, is the responsibility of the Ministry of Education, vocational training of adults comes within the competence of the Ministry of Labour. A corporate body with legal personality known as the "Association Nationale Inter-professionnelle pour la Formation Rationnelle de la Main-d'Oeuvre" (ANIFRMO) has been set up under the auspices of the Ministry of Labour for the organisation of vocational training. The governing body of this corporation is a board of directors consisting of six government representatives, six employers representatives and six trade union representatives. In addition, there are committees which deal with the major vocational groups, comprising five employers' and five workers' representatives. There is also a sub-committee for each individual trade and each "Department," also organised on a joint basis.

The government representatives are appointed by the Ministry of Labour and those of the employers by the Employers Federations. The workers' representatives are designated by the four French Trade Confederations the C.G.T. (Communist), the C.F.T.C. (Christian), C.G.T.F.O. (Socialist) from those trade unions which have a majority of workers in the trade or area concerned. The chairman of these tripartite committees are the government representatives, while the employers' and workers' organisations each provide a vice-chairman; chairman of joint committees hold office for one year.

The Vocational Training Institute includes its own psychotechnical research department.

There are 120 Public Training Centres throughout France run by the Head Office. Each Centre has a director, together with two assistants - one for administrative and one for training matters.

5. Finance

Financing is ensured by a fund provided by the Government; there are no contributions either from the employers or from the workers. We were told that the sum set aside for this purpose during the current year was 180 Million francs. It is worthy of note, however, that employers and workers and individual firms do participate in the financing of some of these activities for instance by paying the wages of trainees and instructors during the period of training (see below).

6. Training in the Firms

Apart from training at the centres, some training is carried out within the firms themselves. This is subsidised by public funds through the Vocational Training Insitute, providing that it conforms to the Institute's standards. In addition, a subsidy is uaually paid in respect of instructors' and trainees' wages during the period of the course.

7. Conditions of admission and selection of participants

Applicants for accelerated training courses must be between 17 and 35 years of age. The upper age limit may, however, be raised providing official consent is obtained. The trade unions are pressing for the abolition of the maximum age limit, so that measures of vocational training can be extended to older workers.

Women have the right of admission, and this also applies to the technical trades. In practice, however, women only take advantage of this in respect of the textiles industry and for office employment.

Applications for training courses are made either on the workers' own initiative (in fact there is even advertising for this purpose) or, in the case of the unemployed, they may be directed to training courses by the labour exchange as a condition for receiving continued unemployment assistance.

All applicants must undergo a psycho-technical test (see below). If the numbers of applicants exceeds the number of vacancies available, a selection is made based partly on the results of the psycho-technical test and partly on the order in which the applications were received. Only about 5% of applicants, however, are actually refused.

8. Duration of Training

Training takes place during the day. Normal courses were formerly of six months duration with a 40-hour week, but they have not been shortened to 5-½ months with a 44-hour week. In the case of particularly difficult trades (such as electro-technician) the course lasts up to 11 months. On the other hand, there are advanced training courses which last only from 3 to 5 weeks.

9. Financial Assistance during Training

Trainees are entitled, during training, to the guaranteed minimum wage, which in France is the same for all trade and is laid down by law. This comes at present to 360 francs per month. In addition, there are extra payments made from the unemployment insurance fund to which both employers and workers contribute; lastly, in certain cases there are payments by the firm which employes the trainee. The wages earned by trainees therefore vary considerably, the minimum being the guaranteed minimum wage and the maximum being between 60 and 80% of the wages earned before training began. On an average, wages during training work out at about twice unemployment assistance.

Where advanced training courses (2nd grade training) are concerned, trainees generally continue to receive their full wages, the employer paying part and the remainder coming from publuc funds.

Trainees are covered by the national health insurance system and are entitled to family allowances.

In addition they are paid travelling costs to and from the training centre or, if they live at the centre, the cost of travelling to visit their families. Actual training costs are borne by the government. About 80 % of trainees live at the training centre, where they are also provided with board. A small sum is deducted from their pay for board and lodging.

10. Security of Tenure of Job

If training does not take place in the firm where the worker is normally employed, his job is usually kept open for him by the employer in cases of retraining and advanced training.

In addition to daytime training as described above, there are evening and week-end courses, for which all expenses are also borne by the state.

11. Pedagogical Principles of Training

Training is carried out in accordance with a standard method based on Cartesian principles.

The individual working processes to be taught are first analysed by scientists and broken down into fractional processes which in turn are classified according to difficulty and arranged in groups. The trainee is first taught the more simple fractional processes and, by the method of proceeding from repetitions of the known to the unknown, is gradually introduced to the more difficult processes.

Trainees are formed into small groups of ten to fifteen and the instructors are encouraged to foster good relations in the group. The instructor first demonstrates the process to be taught and then makes his trainees copy it immediately, so that they can learn from their own experience. The subject of lessons is also available in writing, and copies of the printed lesson are handed out to trainees at the end of each lesson.

Instruction is meant to be kept as practical as possible, and theory is only occasionally used, when considered absolutely necessary.

This method is shown to have been successful, and has thus far also been introduced into Italy, Spain, Portugal and Yugoslavia.

12. Psycho-techniques

We are here referring to the selection and guidance of trainees in accordance with psychological methods. As has already been stated, all trainees are given psychological tests at the beginning of the course, and psychological methods are also sometimes used during the course.

The Vocational Training Institute has its own psycho-technical department for carrying out tests, during which individual trainees are

asked various questions (e.g. mathematical problems for technicians, to which correct answers must be given within a given time limit, 10 to 15 minutes). The results of tests are expressed in marks. Following on the tests, trainees are interviewed by psychologists, university graduates who have a special three-months course. Instruments for measuring the speed of reaction and skill are also used.

The trade unions are sceptical about these tests and the psychological methods used, and the fact is that in practice these methods do not give any indication of the personality of applicants for jobs or traineeships, although this is an important consideration for the success of certain types of training.

13. Teaching Staff

The teaching staff must of course be highly skilled workers. They are released by their firms for three years in order to act as instructors, during which period they continue to receive their wages, in accordance with an agreement concluded between the Ministry of Labour and the employers' federations. Since, however, it has not been possible to recruit sufficient staff in this way, it has been found necessary to train instructors from among the trainees themselves, and particularly skilled trainees are invited to follow a six weeks' course in pedagogics at the end of their training course and serve as instructors to other trainees.

Since the Vocational Training Institute is not a governmental organization, it can pay higher salaries than those to which government officials of the same grade are entitled.

14. Examinations

The courses end with an examination, and an official certificate is awarded to successful candidates. The examining board consists of the trade sub-committee of the "Department" concerned and is composed of representatives of the employers and workers under the chairmanship of the director of the local employment service. Examination tests are drawn up in Paris and distributed to the centres. The examination lasts five hours or more. It is based on the notes which trainees have been given by the instructor during the course. These notes are processed by a complicated system, as a result of which both the quality of the work done and the time taken to do it are assessed. Ninety percent of the candidates are successful. In exceptional cases, the examination may be repeated.

15. Results of Training

Successful trainees are very much in demand, owing to the shortage of skilled labour, so that there is practically no placement problem. Those who have been trained as specialists are officially recognized as such after a short period.

16. Attitude of Trade Union

(a) C.G.T.-Force Ouvriere (French General Confederation of Labour)

Force-Ouvriere is very much in favour of the system, by means of which the advancement of the workers is encouraged, and which results in a rise in average wages. Initially there was some mistrust among older trade unionists with regard to younger ones who had undergone accelerated vocational training, but this difficulty has now been overcome.

So far as the Union's influence on the Vocational Training Institute is concerned, the workers' representatives often work in close co-operation with those of the employers, as for example in the matter of raising the wages of workers in the Institute. Government representatives also work in close co-operation with the workers' representatives, since both sides are concerned that the organization should be successful. The trade unions also have very reliable experts in this field.

A claim is now being put forward that trainees should be paid at least 80% of their former wages during the training period.

One of the disadvantages arising from the fact that in France there are four Trade Unions Confederations is that the degree of co-operation between trade union representatives is not as satisfactory as could be wished (e.g. no joint talks between the representatives of different unions before meetings). This also makes for difficulties in connection with trade union activities in the training centre.

(b) Confederation Francaise des Travaileurs Chretions - C.F.T.C. (French Christian Trade Union)

The C.F.T.C. also favours the vocational training system, its aim being to ensure by this means that all workers have the right to training. The C.F.T.C. also sees advantages in the fact that many workers who were not in a position to receive training when they were young, can become specialists as a result of accelerated vocational training. The fact is that there is a surplus of young workers in France, with the result that, in 1962 for example, 80,000 young workers were unable to find traineeships (either in schools or factories) and therefore had to work as assistants to trained workers. Accelerated vocational training provides them with the opportunity for advancement.

So far as disadvantages are concerned, see "Problems and Difficulties" under 18 below.

(c) Confederation Generals des Cadres (Confederation of Supervisory Staff)

The union consisting of technicians, foremen, supervisors, etc., is also in favour of the system for the reasons which have already been mentioned.

17. Attitude of Employers

French employers were initially very sceptical about accelerated vocational training. Among other things, they considered that this was not a means of achieving sound specialized training. Subsequently, however, they changed their attitude and are now very much in favour of it. They have recognized that it constitutes the means of adapting workers more easily to technical modifications, making up for the shortage of skilled workers and providing facilities for adapting agricultural workers to industry. The employers now actively co-operate in the work of vocational training; they make workers available either as instructors of trainees in the centres and even contribute to their wages, providing that they are ensured of being able to re-employ them after their period of training, or instruction as the case may be, is finished. The French employers' Confederation has undertaken that each firm shall provide a skilled worker as instructor for a given period at one of the centres.

18. Problems and Difficulties

Accelerated vocational training in France has given rise to the following problems:

(1) In certain branches of industry (e.g. the building industry) the demand for traineeships among the workers is insufficient. This is probably also connected with the fact that the number of trainees at present only comes to about 0.1% of the total labour force. The lack of demand for traineeships is partly due to the general feeling of well-being, partly to the fact that there is insufficient publicity in connection with training and also to the lack of financial incentive. What is required to overcome these difficulties is the organization of information and recruiting with regard to training and an increase in the amount of assistance granted during the training period to between 80% and 95% of the former earnings.

(2) Many workers have difficulty in obtaining temporary leave from their jobs in order to attend a training centre.

(3) The present maximum age limit of 35 must be abolished, in order to provide the necessary opportunities for advanced training for older workers.

(4) In certain branches there is not only a lack of trainees but also of instructors. Here again, higher wages would be a help.

(5) Employers are too reserved about future labour requirements; this makes it difficult to make accurate forecasts which, in turn, are essential for the organization of training. A survey of those trades in which long-term training requirements are inherent or recommended, should be carried out.

(6) A further problem, which has already been mentioned, consists in the fact that the French trade unions do not co-operate sufficiently, thus rendering impossible any real trade union activities in the centres (talks, etc., including perhaps the inclusion of labour rights in the curriculum).

III. A few conclusions of interest to Austria

The following points concerning the French system of accelerated vocational training are of particular interest to Austria.

1. Training in France is concentrated, not so much in the firms, as in official training centres which are jointly managed by the Ministry of Labour, the employers and the workers. This makes possible a more intensive system of training then would be possible in individual firms; it is a system which has proved its worth.

2. Training organizations are administered by an independent corporation; this has the advantage of making a concentration of work possible, and above all that the instructors employed in the centres are not considered as government officials and can therefore be paid wages in line with those paid in private enterprises.

3. Training is not financed by contributions from employers and workers but from the State budget.

4. The training period is much longer than in Austria (average of $5\frac{1}{2}$ months as against a few weeks in the case of daytime training in Austria) and training is therefore more thorough.

5. Financial incentives for training are considerable. In the case of advanced training, the full wages are paid, and in other cases between 60% and 80%; in addition traveling and training expenses are borne by the government. In Austria, on the other hand, only a proportion of the workers receive their unemployment benefits, which amount to only 30% of wages, and even traveling and training expenses generally have to be borne by the trainee.

6. Trainees have the possibility of living in the training centre, which constitutes a considerable advantage in rural areas where distances are involved.

7. The pedagogical system of training (systematic organization of practical work according to difficulty) is shown to be very effective.

8. It is also interesting that instructors can be selected from among trainees and that there is an agreement between the Ministry of Labour and the Employers' Confederation as to long-term leave for highly skilled workers who are prepared to act as instructors.

9. It is also interesting that French employers are so much in favour of the system that they grant leave to trainees and potential instructors and continue to pay a part of their wages while they are engaged in the centres.

10. Our experience in France also indicates the special significance of proper publicity and recruiting for such training.

National Council for Homemaker Services

The National Council for Homemaker Services was incorporated in 1962 to stimulate the expansion and promote the improvement of homemaker services throughout the country. Membership is open to agencies providing homemaker services and to organizations and individuals interested in supporting the Council's purposes.

Working cooperatively with other national health and welfare organizations and with public and voluntary agencies, the Council:

- Promotes understanding of the values of homemaker-home health aide service
- Provides a central source of information and a medium through which knowledge and experience can be pooled and made available
- Encourages and guides communities in organizing and extending homemaker-home health aide programs
- Promotes development of standards
- Publishes reports and distributes educational and promotional materials
- Sponsors conferences and seminars.

Foreword

It is the hope of the National Council for Homemaker Services that this report of the 1967 Forum, held in New York City, May 4-5, will serve as a sequel to the report of the 1964 National Conference on Homemaker Services. The three-year span between these two national meetings was a period of tremendous activity in the Homemaker-Home Health Aide field.

While both meetings were national in character, attracting volunteer and professional personnel from Canada, Puerto Rico and all sections of the United States, there were marked differences in approach and in content of the sessions. The 1964 Conference brought together some 800 participants to consider all aspects of the service, to share experiences and exchange ideas and information — to discuss a wide variety of problems and possible solutions, to view the entire field in relationship to the growing need for homemaker-home health aide service, and to explore potentialities for expansion of the service.

The 1967 Forum, on the other hand, was deliberately less comprehensive in content and more concentrated in approach. Advance registration was opened first to Council members only, with a limit set at 300, but the enthusiastic response of members and non-members alike made it necessary to extend the limit to 400. Obviously, it was impossible to roam the length and breadth of the field in two days of deliberation; therefore, the attention of participants was directed to two major areas of concern — the implication of recent legislation which provides that care in the home be made available, under certain conditions, for all who need it; and problems related to financing adequate homemaker-home health aide services. These two vitally important areas were carefully examined in the plenary sessions and were freely discussed in each of the six workshops which were conducted concurrently as a part of each day's schedule.

Although priority was given to two major areas, it should be noted that participants found themselves speaking inevitably of other related concerns such

as staffing, recruiting, training, fund-raising, and keeping the service unified. Emphasis was placed on the need for increasing the traditional use of homemaker-home health aide service to help families with children, along with initiating and improving new uses of the service called for by recent, important developments in the health field. The 1967 Forum, significant and productive in its own right, served effectively to set the stage for another national conference in 1968.

At the close of the Forum, a number of participants wrote to the Council office, expressing their reactions to the sessions. One man wrote: "Even before leaving New York, I must write to say what a successful meeting this was . . . I learned a lot, and this feeling is shared by the other participants from my area. Our orientation has been strongly in the health care field, and I think we've done a satisfactory job there. But the two-day meeting has broadened our perspective, and we've already decided to try to stimulate our local people to take a harder look at the broad picture."

Much of the success of the Forum can be attributed to the active participation of members of the NCHS Board of Directors who served as chairmen of key committees, workshop leaders, major speakers, or assumed responsibility in other important areas. Special mention must be made of the effective leadership of Mrs. Clarkson Hill, Chairman of the Planning Committee, and Mrs. John M. Wagner, Chairman of the Program Committee.

The Council deeply appreciates the valuable contributions made by all who worked on Forum committees, presented papers at the sessions, or served as resource personnel or recorders in the workshops. We are grateful to the American Medical Association for publishing "Highlights," a compilation of major Forum papers, immediately following the meeting. Our special thanks go to the Metropolitan Life Insurance Company and The Equitable Life Assurance Society of the United States for their financial contributions in support of the Forum.

As this report is submitted, we are looking ahead to 1968 when we shall meet again to continue exploring better ways to serve all the people who need homemaker-home health aide service.

Betty Trippe

Mrs. Juan T. Trippe, *President*
National Council for Homemaker Services

On the Way to the Forum

They came from 34 states, Canada and Puerto Rico to contribute to and take something from the Forum, held in New York City in May 1967 in conjunction with the annual meeting of the National Council for Homemaker Services. Many of them were the same professional workers and volunteers who attended the first National Conference on Homemaker Services in Washington, D. C., in 1964 — and, in the three-year interval, they had gained a great deal of experience and sophistication, and had lost none of their enthusiasm and determination. Many others, new in the field, were equally enthusiastic and determined — and eager to learn from the experience of veterans.

There was an atmosphere of excitement, of expectancy, in the meeting rooms and corridors at the Forum where participants talked and listened with the same concentration, posed difficult questions, offered possible answers, and never for a moment lost sight of their common objective: provision of effective homemaker-home health aide service for all families and individuals who need it, whether their problems are related to health or social welfare. It seemed as though the Forum were the focal point of the tremendous momentum that had been building up over the past three years throughout the country. Despite the fact that all, apparently, had been running at top speed during the interval and no one had caught up with the jet stream of need for service, there was heard no sigh of discouragement — only a rising note of confidence and resolution.

"The most striking feature of the Forum and annual meeting was the diversity of backgrounds of the participants and the high level of competence of all involved, both professionals and volunteers," was the view expressed by a participant from Ohio in a report to her agency.

The welfare and health fields were represented in just about equal numbers, the former by social workers and the latter by physicians and nurses. They came from small and large community agencies, public and voluntary; from state departments of health and welfare, university faculties, and national health and welfare organizations. As the sessions progressed, the impression was that the National Council does indeed reflect the vision and the thinking of the broad field in which homemaker-home health aide service is developing so quickly out of adolescence and facing the complex problems that accompany maturity.

Three Years of Growth

Three years can be eternity if one is hanging by his thumbs, or they can be too brief a moment if one is caught up in high-gear activities that challenge his intelligence, skill, imagination and ingenuity. It was obvious that, to Forum participants, the interlude between the two national conferences had seemed far too short a time for all that needed to be done — yet, measured in terms of what actually had been done, those three years might well have been a decade.

A report of preliminary findings of the survey conducted to obtain information for the 1966-67 Directory of Homemaker-Home Health Aide Services highlighted the remarkable expansion of service since 1963. Much of this unusual growth was stimulated by the National Council and the Welfare Administration, U.S. Department of Health, Education and Welfare, and was planned and directed by persons attending the Forum. Over the three-year period, the number of service programs had nearly tripled, the number of homemaker-home health aides on the job had doubled, and the number of families served had quadrupled. The actual figures reported were:

	1963	1966
Service programs	303	812
Homemaker-home health aides	3,900	7,900
Families served	6,000	24,000

The greatest expansion occurred in the area of public welfare where the number of services increased from 93 to 385, and next in line was public health where the jump was from 15 services to 84. The following table, taken from the preliminary report prepared by Mrs. Grace W. Bell, Chief of Special Services, Methods Group, Bureau of Family Services, Welfare Administration, U.S. Department of Health, Education and Welfare, indicates the growth of homemaker-home health aide service during the three-year period under various auspices.

Homemaker-Home Health Aide Services

	1963	1966
Public Auspices		
Public Welfare	93	385
Public Health	15	84
Other	4	13
Voluntary Auspices		
Family and Children's Agencies	116	144
Visiting Nurse Associations	21	58
Home Health Agencies	12	20
Independent Community Programs	32	70
Other	4	12
Combined Public & Voluntary	6	14

In 1963, ten states reported no homemaker services; by 1966 all states and territories, except Idaho and the Virgin Islands, reported at least one homemaker-home health aide service, and most reported more than one. A service program

was being developed in the Virgin Islands, but was not operational, while in Idaho homemaker service was provided on an informal basis by the public child welfare service, but no formally organized program had been set up. It was noted that many of the states reporting the greatest expansion of service were those where state consultants on homemaker service were attached to the state welfare office, as in Minnesota, New York, North Carolina and Wisconsin. In Massachusetts, it was the state health department that took the lead in developing the service.

Response to Legislation is Slow

Recent Federal legislation and the availability of increased public funds in both the health and welfare fields were identified as important factors influencing the growth of homemaker-home health aide service. But the survey questionnaires reflected a surprising lag in the field's response to the 1965 Medicare and Medicaid legislation (Titles XVIII and XIX, Social Security Amendments). Total number of services provided under public and voluntary health auspices increased from 48 in 1963 to only 162 in 1966. Far greater expansion might have been expected, with funds available for homemaker-home health aide service as an essential part of home care for the aged sick and for low income families unable to cope with health or social problems.

It was noted that this was not the complete picture, for many agencies reported they were providing service under third party payments or on contract with other agencies and, in this way, were receiving Medicare funds. However, it was obvious that the impact of Medicare and Medicaid was just beginning to be felt in the field.

Mrs. Bell reported that a study of the survey findings indicated a growing trend toward provision of a broad-scale service by social welfare agencies, public and private, and by the so-called "independent" community agencies, including those financed by the Office of Economic Opportunity.

"I anticipate," she said, "that we will find more and more programs seeking to serve all people in their own homes, whether the need for 'home help' stems from absence of the parent, disability, illness or from problems strictly social in nature. The trend is to fit the service to the need, not the individual to the peculiarities of the agency."

Despite these encouraging developments, she warned, workers must remain keenly aware of the great gaps in the field, of the extremely uneven quality as well as quantity of service, of the serious lack of adequate training programs and specialist consultation. The status of homemaker-home health aide service in 1966, measured against its availability in 1963, was indeed satisfying — but, measured against national need, it represented only a small beginning in the enormous task of providing truly adequate service.

The Forum was, in no sense, a triumphant celebration of ultimate success after three years of concentrated effort; it was, rather, a brief pause for review, assessment, and re-charging for a running start into the next period of continuing expansion and improvement of service for increasing numbers of families in need of it.

THE FORUM

Current Realities and Future Opportunities

The demonstration period was over; the effectiveness of homemaker-home health aide service, as an essential link in the community's network of health and welfare services, had been thoroughly documented.

"I know of no other specialized service which makes so great a contribution to the welfare of families, the aged and disabled, and to the services of other social agencies," asserted Ellen Winston, Ph.D., U. S. Commissioner of Welfare, at the opening Forum session. Her statement was founded, not on conjecture and hope, but on personal observation of the service in operation in many different places in a variety of settings, in response to widely divergent needs.

The American Medical Association's "intense and continuing interest in homemaker services, as an important facet of the over-all field of home health care" was reaffirmed by Charles L. Hudson, M.D., AMA President. He referred to the service as a "vital part" of a community's home health program.

Forum participants launched their discussions from a pad of total acceptance, speaking out of the knowledge that homemaker-home health aide service is necessary, well established, and here to stay. That is not to say the service was free of problems. No, indeed! Everyone concedes that money, as a medium of exchange, is necessary, well established, and here to stay — but this does not mean the end of money problems. Wherever participants gathered in groups of two or more — whether in the lounge, the meeting rooms, the hallways or the elevators — there was talk of the need to expand and extend services, to develop better training programs, to combine scattered services under a single sponsorship, to find a way to meet social welfare and health needs equally well, to gear the service to priority needs rather than to sources of income, to interpret the service to all residents of the community . . . and to perform many other tasks that were neither simple nor easy.

Six workshop groups met concurrently on both days of the Forum, with more than 60 participants in each group. Each workshop, led by a Council board member, had a recorder and a resource panel of four persons representing the fields of coordinated home care, nursing, social work and the field in general. The four broad areas discussed in all workshops were: patterns of organization and administration, financing, staffing, and integration of services.

Impact of Medicare

Throughout most of the Forum discussions one word kept recurring with the regularity of a fog horn, and sometimes in a comparable tone of warning. The word was MEDICARE. Behind the word was Title XVIII of Public Law 89-97, the health insurance program under Social Security. The Medicare law, by including home health services under benefits covered in Title XVIII, made possible — as a matter of fact, made imperative — significant expansion of these services for all Americans 65 years of age or older. The hospital insurance

program pays for up to 100 home health visits in the one-year period following most recent discharge from a hospital or extended care facility (nursing home); in addition, the Medicare voluntary medical insurance program helps to pay for up to 100 visits in each calendar year, regardless of hospitalization. Visits may include part-time nursing care, therapy (physical, occupational or speech), medical social service, and the services of homemaker-home health aides.

The Medicare law became operative in mid-1966 and, in the following months, tremendous effort was directed toward assisting agencies in meeting requirements for certification as home care agencies under that law. At the same time, the very existence of the law carried various implications and generated many questions in the minds of workers in the field. Answers were sought for such queries as:

> "If we provide homemaker-home health aide service for Medicare beneficiaries, will we have enough resources to expand our service for other families who need it?"
>
> "How can we prevent the development of two separate services — one geared to health needs, and the other to social welfare needs?"
>
> "Does this mean that our training programs for homemaker-home health aides and the nature of our service will become more and more health oriented?"
>
> "Medicare payments often are extremely slow in coming through — how do we manage the financial problem this creates?"
>
> "How can we develop our record-keeping procedures to determine 'reasonable cost' which is essential for obtaining reimbursement for care of patients who are Medicare beneficiaries?"

To some Forum participants, Medicare was already a hard fact, a way of professional life; to others it was still just a paper law. And it was difficult to determine which group came armed with the greater load of questions. There was general recognition that all, sooner or later, would be involved in or significantly affected by the Medicare and other insurance programs.

The Council viewed the law as one of the major developments in the field since 1923, the year accepted as the birth date of homemaker-home health aide service in the United States. Scheduled as a major address in the Forum's opening session was a discussion of the implications of Title XVIII by John W. Cashman, M.D., Director of the Division of Medical Care Administration, Bureau of Health Services, U. S. Public Health Service.

Pointing out that home health services were only part of the broad spectrum of health services made available under Medicare, Dr. Cashman reported that some 6,800 hospitals and nearly 3,700 extended care facilities had been certified for participation in the program, as of April 1, 1967.

"The 1,800 certified home health agencies," he declared, "serve as a vital link in the chain of community resources which makes continuity of patient care today more feasible, more practical than ever before."

To qualify for certification, a home health agency must provide, in addition to nursing care, at least one other therapeutic service. In 1963, not more than 200 agencies could have met this requirement, but by the spring of 1967 the number had grown nine-fold and certified home health agencies were located in every state except Alaska.

Under what auspices were these agencies operating — and what additional therapeutic services were they offering? Of the first 1,400 certified, 626 were official health agencies, 530 were administered by Visiting Nurse Associations, 125 by hospitals, 90 by a combination of public and voluntary agencies, and 28 were under other types of auspices.

"In terms of volume of services provided," Dr. Cashman asserted, "the home health agencies administered by Visiting Nurse Associations have set an outstanding record from the very start of the Medicare program."

In regard to therapeutic service provided, in addition to nursing, he reported that of this same group of 1,400 agencies, 72 per cent offered physical therapy, 35 per cent offered homemaker-home health aide service, 23 per cent gave speech therapy, 21 per cent provided medical social service, and 15 per cent offered occupational therapy. He noted that 65 per cent of the agencies provided two or more services in addition to nursing.

Converting the Medicare law into an effective program throughout the United States was a gigantic task, requiring a great deal of innovation, adaptation and cooperation. It could not be done overnight, nor even over a nine-month period, but by April 1, 1967 a solid and encouraging start had been made and many elderly persons were already receiving benefits. During the first nine months, nearly four million hospital admission notices had been received, along with some 173,000 home health "start of care" notices — for each admission to home care, there were 22 hospital admissions. The record shows that nearly 19,000 Medicare patients were being admitted each month to home care. The record also reveals that a surprisingly high proportion — 70 per cent — were admitted to home care without prior hospitalization, highlighting the urgent need for home health care services geared to prevention of hospitalization and institutionalization. This situation points up a serious gap in the Medicare law, for it does not provide funds for preventive services. The necessity of meeting the needs of this large group of elderly individuals, from a humane as well as a practical viewpoint, creates a serious administrative problem for the agencies involved.

Problem Areas Identified

Eight major problem areas which impede progress in the important task of improving home care programs, in which homemaker-home health aide service is an essential ingredient, were identified by Dr. Cashman. He called for action at the community level where these problems can be attacked and resolved more effectively than at the national level. The eight problem areas are:

1. Lack of understanding of home health services among consumers, providers, and fiscal intermediaries

2. Financial problems of agencies that can be attributed to (a) faulty initial planning; (b) precipitate withdrawal of community funds; (c) the necessity to design and maintain a complex set of financial records; (d) unfamiliarity with deductibles and coinsurance; (e) no previous experience with fiscal intermediaries; (f) contracting by home health agencies for home health aide service
3. Failure of agency staff to understand the significance of some of the Conditions of Participation and the inter-relationships among them
4. Lack of experience and know-how concerning the organization and effective use of medical advisory committees
5. A long standing pattern of insufficient attention to the form and substance of patient records, particularly the clinical records
6. Shortages in most of the kinds of personnel needed to staff a home health agency
7. Outmoded personnel policies, including state and local civil service requirements that call for full-time staff; and finally,
8. Difficulties in achieving harmony among the several home health agencies a community supports.

Both Dr. Cashman and Dr. Hudson pointed to lack of awareness and understanding as a prime cause of the wide gap between the need for and provision of home health care services. If people don't know a service exists in the community or do not understand why it exists, they cannot apply for it or even realize they need it — nor will they support it.

Service Must Be Interpreted

Letting everyone know what the service is and what it does is a basic first step which may well determine the length and direction of later steps. The story of home health care and of homemaker-home health aide service must be told repeatedly through the spoken and written word and, whenever possible, through pictures. To reach all community groups, every channel of communication must be used — community and neighborhood newspapers, radio and television, business and industrial house organs, church publications, speakers' platforms.

Equally effective — or, probably more effective — is the kind of informal interpretation that can be done at dinner, across a bridge table, at the swimming pool, on a golf course. Dr. Cashman reported that both the U. S. Public Health Service and the Social Security Administration conduct extensive information programs, designed to reach beneficiaries and providers. But, he added, this is not enough.

"Agency board members," he said, "can be extremely successful in state and local communities because many of them serve also on the boards of other agencies and have far-reaching community contacts. Agency executives can make an enormous contribution by arranging for physicians and staff members

of area-wide planning agencies and fiscal intermediaries to visit the home health agency and by making arrangements, if possible, for a few key people to visit patients in their homes. We have tried this expedient with Federal staff, as a part of orientation, and know that it works well."

Dr. Hudson's concern was directed to those physicians — and there are far too many of them — who are unaware of the benefits of home care for their own patients.

"A home-centered care program cannot really succeed without the physician," Dr. Hudson said. "It cannot reach all of those who need its services without referral and direction from the patient's physician."

One of the best ways to enlist the interest and cooperation of physicians in home care services is to involve the medical community in initial planning and implementation of the program. The American Medical Association, through its official Journal last year, urged all physicians to participate in home care programs for the benefit of their patients, and charged local medical societies with the task of providing "community leadership in improving the coordination of existing home care services and in stimulating development of new services where they are needed."

It may seem odd that so much attention was given to the discussion of problems related to home care programs when, actually, only about one-third of those programs included homemaker-home health aide service. But it must be kept in mind that what happens to the rapidly developing home care programs, under Medicare, has a direct effect on what happens in the homemaker-home health aide field for it is anticipated that, ultimately, the service will be incorporated into every home care program. This expectation has given added impetus to the National Council's activities in promoting broad understanding of the purposes and values of homemaker-home health aide service. Much of the Council's work in this area has been designed to help its member agencies interpret the service in the local community. For example, available at the Forum were publicity kits which included a sample speech, a one-page fact sheet, and a variety of newspaper and radio materials that could be adapted easily to the local situation. Many participants expressed appreciation for these items tailored to help meet pressing local needs.

A memorable highlight of the Forum was the premiere showing of "Homefires," a 28-minute dramatic sound-film presenting a homemaker-home health aide on the job in three different homes, helping families cope with various problems. Response of the audience was extremely enthusiastic. Here was a film, many of them said afterward, which combined strong emotional appeal with clear, straightforward information so expertly that the viewer carried away both feeling and knowledge. "Just what we want," they added, "for showing to service clubs, PTAs, church groups, professional organizations, women's clubs and civic groups in our home towns."

The U. S. Office of Education made it possible for the Mental Health Film Board to produce "Homefires." The intent, from the very beginning, was to create a film that would serve, with equal effectiveness, as a recruiting and training tool for homemaker-home health aides and as a vehicle for interpreting the service to community groups, as well as to far larger audiences through

showings on local television stations. The film demonstrates the specific kind of help a homemaker-home health aide gives to elderly individuals who are not well and can no longer manage completely on their own, to a family of young children whose mother is being rehabilitated after an accident, and to a family struggling with the anxiety created by a mentally ill member. The relationship of the homemaker-home health aide with her supervisor, as well as with other professional workers helping the same family, is clearly portrayed. Her role in helping a family raise its standard of living is also shown. It was the consensus of the Forum that wide use of the film would help substantially to inform the American public about homemaker-home health aide service and to narrow the gap between need for and availability of home health care.

Three Professions View Integrated Services

The integration of homemaker-home health aide service with other community services as a prerequisite for effective home care was examined by a nurse, a social worker and a physician.

Turning to Mr. Webster for an authoratative definition, Winifred Kellogg, Assistant Director of the Visiting Nurse Association of Detroit, pointed out that "to integrate" meant "to form into one whole — to make entire or perfect." By direct application, she added, integration of homemaker and nursing service should facilitate the provision of a "whole" or "perfect" service for the benefit of the patient.

She recalled that always the public health nurse has depended on capable members of the family "to keep the patient warm, fed, clean, medicated and appropriately active or quiet between professional visits." Integration of their services with those of the physician and nurse made up the "whole" of care required by the patient. The absence of such a dependable family member has posed for the nurse a most difficult and frequent problem. By assuming the role of the concerned family member, the homemaker-home health aide fills the void and resolves the problem.

The Detroit VNA employs the home health aide to give personal care to patients and housekeeping service to their families, Miss Kellogg reported. Although the worker is called a "home health aide," her function is actually that of a "homemaker-home health aide." The physician prescribes home care and the service the patient requires, and the agency staff decides when the service of an aide is needed. The case worker, nutritionist and other consultants participate with supervisor and nurses in deciding on placement of aides and guiding the service.

In 1966 the VNA provided home health aide service for 542 families. In addition to personal care, services received by these families included help with child care, food preparation, cleaning, laundry and shopping. In mid-year, the agency was certified as a participating home care agency under Medicare, and the use of home health aides began increasing steadily — at the end of the year the agency had 56 aides on staff, although only 40 such positions had been budgeted.

"It is not possible at this time," Miss Kellogg said, "to measure the probable impact of Medicare and Medicaid on health care of the aged and the economically deprived. But it is possible, already, to see and feel their influence on the integration of home health aide with nursing and other health services required for the 'whole' of care."

The importance of integrating homemaker services with other community services, from the point of view of social work, was discussed by Clark W. Blackburn, General Director, Family Service Association of America, one of the founding fathers of the National Council for Homemaker Services.

In establishing the Council, he said, "it was our hope to create a national organization that would serve as an umbrella for both social welfare and health interests."

He interpreted the oversubscription of the Forum as a testament to the vitality of homemaker-home health aide service and as an indication that, in the field, there was recognition of the need for the different disciplines and professions involved to talk and work together, to explore ways of merging their services in a broad program that would best serve the people of their community.

The physician's viewpoint was expressed by Francis E. Browning, M.D., President of the Home Care Association of Rochester and Monroe County (N. Y.). Dr. Browning described how homemaker-home health aide service had been integrated into the coordinated home care program administered by the Association. The program was established in 1960 to fill a void in community services — to meet the needs of patients who could be spared institutional care provided centrally coordinated multiple services were available and used efficiently.

The Association staff provided no direct services for patients, except for social work service and intravenous therapy service, Dr. Browning said. All other direct services were provided by other agencies through contractual agreements. Home health aide service, for example, was provided by the Visiting Nurse Service.

"We cannot overemphasize the importance of the home health aide in the intensive type of coordinated home care program," he asserted. "Without this service, our program would have to reject more than 70 per cent of the patients we now serve."

There was a recognized distinction between homemakers and home health aides in the Rochester program. Dr. Browning reported that homemakers were used in selected situations, but the use ratio of aides to homemakers was about 13 to one because most patients needed direct service from the aide.

"I realize," he added, "that some communities train persons to function either as a homemaker or as a home health aide to achieve maximum flexibility in the use of personnel. At the present time, we obtain homemaker service from an agency other than the Visiting Nurse Service. This division is the result of practical considerations. I feel sure this general concept will come up for discussion during the workshop meetings."

And indeed it did! There was a great deal of talk about the danger of a split down the middle, at the point where the hyphen appears in homemaker-home health aide service. Such a separation, one participant commented, would

mean that a home health aide could wash the patient's face — but not the dishes. A homemaker would have to be assigned to the latter task. It was recognized that, in some areas, steps had been taken to separate the function of the homemaker from that of the home health aide, with different approaches to training, supervision and salary scale.

Appeal Made for Unified Service

A strong case for keeping the service unified was made by Mrs. Asher Yaguda, member of the NCHS Board of Directors and President of the Woman's Auxiliary to the American Medical Association, in a major address to the Forum. While other speakers had touched lightly on this problem, she gave it full attention, examined closely its implications and accepted it as a challenge to action. She called for concerted effort in the field to retain the hyphen in the term "homemaker-home health aide" and to equalize the training, supervision and salary for all workers carrying that title.

"We agree," she said, "that the motherless home may not need personal care services, but we find no reason for the homemaker in this situation not having well-rounded training. Her next case may well be an elderly, chronically ill person."

Mrs. Yaguda could find no valid justification for training two sets of homemakers to serve the same families. She indicated that personnel shortages alone made this kind of operation a luxury few communities could afford. Illness in the family often created the need for homemaker service, but the homemaker assigned to such a family was expected usually to do more than care for the sick individual. It became obvious, as she spoke, that the most practical and efficient procedure was to train all homemaker-home health aides to work in both the health and social welfare fields, to care for the sick and the handicapped as well as to manage a household and look after children.

Use of the term "home health aide" throughout the text of the Medicare law was viewed by Mrs. Yaguda as a serious threat to unified service. She suggested that the time might be right for the voluntary sector to move to persuade Congress to restore to this worker the time-honored, generic term, "homemaker."

Need vs. Source of Funds . . . and Other Concerns

Many participants expressed concern about the growing tendency to gear service to the available sources of funds rather than to existing need. Some pointed to Medicare and Medicaid programs as significant contributors to this trend. Agencies struggling to finance homemaker-home health aide service designed to meet total family needs have found it tempting to abandon their broad program and direct their efforts to providing a single health-oriented service which would be financed under Medicare or Medicaid. While such a step might solve the agency's financial problems, it would leave many families without the help they need in coping with social problems.

However, a more optimistic note was struck by Dr. Ellen Winston in her discussion of Medicaid, the health care program provided through Federal-State partnership. Medicaid funds can pay for homemaker-home health aide service for low-income families or individuals who need help because of illness or disability, but not for families or individuals who need help in raising their living standards or combatting other social ills.

"But, to the extent that services can be financed with Medicaid funds," Dr. Winston asserted, "other public funds are freed to pay for service to deprived families that do not have pressing medical problems. Thus, the total homemaker-home health aide service program can be expanded."

She urged Forum participants to work with citizen groups in their own states to make sure that the Medicaid program included provision of homemaker-home health aide service and that a homemaker service specialist was attached to the state public welfare staff. While Dr. Winston spoke strictly from the viewpoint of public welfare, she gave full recognition to the recent growth of homemaker-home health aide service under public health and voluntary health and welfare auspices, and stressed the need for continued acceleration of all these efforts.

Such acceleration calls for recruitment of more homemaker-home health aides, a task that was thoroughly discussed in workshop sessions. Most participants agreed that recruitment, in and of itself, posed no major problem. Homemaker-home health aides already employed had proved to be the most effective recruiters, for they had first-hand knowledge of what the job entailed and what qualities were required to do the job well; word-of-mouth was their best channel of communication. Some agencies had found candidates by placing notices in neighborhood newspapers, community newspapers, church bulletins, and preparing recruitment spot announcements for local radio stations. Agency board members, volunteers and staff, in some areas, had recruited workers simply by talking about the service and the need for homemaker-home health aides to their friends, acquaintances and neighbors. It was apparent that in most communities there still existed a large reservoir of woman-power which had scarcely been tapped . . . women who had reared their own children and managed their own households, who now had time on their hands and wanted to earn money by working in a job they enjoyed and in which they could excel.

Civil Service Tests Questioned

A few participants shared a common need for help in resolving an employment problem related to Civil Service procedures. In some areas where homemaker-home health aides were certified as Civil Service employees, difficulty had arisen over the use of screening tests which did not actually measure the specific abilities and knowledge required for the job. The problem stemmed from the fact that many homemaker-home health aide candidates were totally unaccustomed to taking tests of any kind and became so fearful and confused when confronted with this alien task that they could not function. Agency executives have learned that quite often a candidate who is inarticulate in a

first interview relaxes later when the strangeness of the setting and the procedure wears off and can then discuss her own feelings and desires, needs and capabilities. It is not odd that such women are blocked when required to take a written examination.

It was suggested that an effort be made by the Council to work with the U. S. Civil Service Commission in formulating an appropriate screening procedure for determining the eligibility of homemaker-home health aide candidates. Such a measure would help to assure certification of those persons truly qualified and adequately trained.

It was recognized in workshop sessions that there is urgent need for generic training standards and a tested curriculum pattern, using a multi-disciplinary approach. Some suggested that training programs should be more comprehensive than the accepted minimum guidelines indicated and that personal care should be an integral part of those programs. On the other hand, there were those who questioned the wisdom of, and need for, training all homemaker-home health aides to give personal care to an ill family member in addition to meeting the other needs of the family. The latter pointed out that homemaker service was needed by many families in which there was no problem involving illness. This statement was countered by the first group who maintained that workers must be trained to serve as both "homemakers" and "home health aides" because a family's social problems are inexorably tied in with health problems. The feeling was expressed that perhaps specialization — that is, training in care of the handicapped or the mentally retarded or other persons with special problems — should be related to placement and in-service training rather than to basic training of the homemaker-home health aide.

Patterns of Organization Discussed

Out of the general sessions, out of the workshop presentations and discussions came the clearly defined impression that here was a field in which the atypical was typical. No master plan for administering, staffing or financing the service had emerged because many different plans had been put into operation — and who was to say which one should serve as the official blueprint? Variety was the rule — not the exception. Most services were community-wide, some were county-wide, and a few were regional; some were provided only for families receiving public assistance, others for families *not* receiving such assistance. Services were being provided by community-based agencies, public welfare or public health departments, Family Service agencies, Visiting Nurse Associations and hospitals. Financial support for the service came from the local United Fund, Federal funds, insurance programs (Medicare, Blue Cross, etc.), foundations, individual and corporate contributions, fees paid by recipients of the service — or any combination of these sources.

A plenary session devoted to patterns of administration, staffing and financing of homemaker-home health aide service, on a state, regional and local basis, provided material for further discussion along comparable lines in workshop sessions.

Development of New Jersey's statewide program was described in some

detail by Mrs. Ruth V. Bien, Executive Director of the Visiting Homemaker Association of New Jersey which works closely with the Division of Chronic Illness Control, State Department of Health. The program consists of autonomous local services, with guidance, coordination and financial aid provided by the state. Local services are community supported by individuals and by voluntary and governmental agencies. Mrs. Bien reported that Medicare necessitated increased recruitment and publicity and twice as many training courses. In 1966, training was given to 506 homemaker-home health aides, a 91 per cent increase over 1965. Integration of services went smoothly, she said, and the only snag was slowness of payment. All local agencies used a uniform, state approved cost analysis and statistical reporting system.

The regional operation of Intercommunity Homemaker Service, covering five separate towns in the western suburbs of Boston, was discussed by Robert B. Hill, Executive Director of Family Counseling Service (Region West) in Newton, Mass. In 1962, Mr. Hill recalled, a group of representatives of the five towns decided that homemaker service might do better on a coordinated regional basis rather than as separate services operating in each of the five communities. This arrangement made it possible to recruit homemakers from a wider geographical area and to spread the cost of the service among several communities.

Concurrent with the growth of homemaker services, Mr. Hill reported, United Community Services had developed by January 1963 a blueprint for a series of regional family agencies in Boston's suburbs. Now in its fourth year, he said, Family Counseling Service (Region West) is a nine-town area which includes the five towns served by Intercommunity Homemaker Service. The two agencies have been brought together to consider the advisability of affiliation. Such liaison would help the homemaker agency financially, for United Community Services would provide deficit financing in an amount comparable to the State Health Department grant which had been provided during the first three years of the agency's operation. Affiliation would also make available casework service and consultation with medical social workers when needed by the Intercommunity Homemaker Service. Joining of the two agencies, Mr. Hill noted, should prove highly beneficial to both.

Importance of a strong, working board of directors for a growing agency was emphasized by Verna M. Criss, Executive Director of Berks County Home Service, the only homemaker-home health aide service agency in Reading, Pa. Problems of budgeting, fund-raising, public relations and inter-agency communication, she said, often can be handled most effectively by well-informed board members.

To administer a program with funds coming from fees, United Fund, and from county, state and Federal grants, Miss Criss pointed out, requires a well organized, adequate bookkeeping system. She reported that her agency used the service of an accounting firm to aid in bookkeeping and record keeping. The agency's staff included an assistant director, a full-time registered nurse, a part-time public health nurse, a bookkeeper and a secretary. Miss Criss expressed the hope that the agency would continue to be flexible enough to adjust to community needs and to new legislation.

Some Uniformity Deemed Necessary

The only apparent common denominator in the field was the commitment to meet human needs within the home. Much of the discussion in workshop sessions seemed to be a kind of preface to the development of a master plan of operation, a plan which would provide the framework for a stable, consistent, efficient and effective service, permitting the freedom and flexibility so essential to this particular service. There was general agreement that this was a task to which a later national conference might well address itself.

There were two areas in which the pressing need for uniformity was recognized by all participants — record keeping and cost accounting. Importance of the latter had been heightened by the advent of Medicare, for the law required an accounting of "reasonable cost" of service prior to reimbursement to the agency providing service.

It was suggested, during workshop discussions, that it would be extremely helpful if the Council could set up a project to do at the national level what could not be done locally: to examine the various recording systems in use (including intake, service, personnel and finance), determine the system that is most effective and promote its adoption by local agencies. It was the considered opinion of many participants that some serious problems might be resolved by the establishment of standard procedures in record keeping.

Need for Harmony Recognized

The need to achieve and maintain harmony among the various disciplines and professions whose cooperative efforts are essential to the provision of top quality home care programs was given full recognition at the Forum. And, at the same time, the unpleasant truth that meeting this need was one of the most difficult tasks confronting the health and social welfare fields was honestly discussed.

Nurses and social workers spoke frankly of the "stress" between the two professions and of the difficulties often encountered in cooperative projects. They agreed that the two groups should examine jointly these areas of "stress" so that, with greater understanding, they might better coordinate their efforts to serve, without overlapping or duplication, patients who need help at home.

Dr. Cashman viewed the problem in broader outlines and noted its direct effect on homemaker-home health aide service. He reported that in some communities, the home health agency looked on the homemaker-home health aide agency as its satellite, ignoring the fact that it had been in operation many years and that its consumer group was much larger than the aged population entitled to Medicare benefits. Such a homemaker-home health aide agency, he said, could not be expected to abandon the families it had been serving over the years.

He referred to executives of some nursing agencies who were over-concerned with doing business as usual and were reluctant to enter into an agreement with other community agencies to establish a certified home health agency, thus depriving the community of Medicare benefits.

"Board members and executives alike," Dr. Cashman declared, "must devote special attention to such situations to weld a true partnership among the agencies."

So Little Time . . . So Much to Explore

Workshop sessions were marked by a kind of breathless quality, an urgency that stemmed from the knowledge that there was so little time and so much to question, to examine, to learn. The leaders' task was not one of stimulating discussion, but of keeping it on an even keel, regulating the bombardment of questions, restraining enthusiasm when it threatened to turn the dialogue into a chorus. The eagerness of participants to talk about problems besetting their agencies, and to find clues in the experience of others, reflected a deep need for communication.

In a sense, these were workers fresh from a revolution — a quiet revolution, but none the less disrupting. Many homemaker-home health aide services had just begun to narrow the gap between need and service in their communities when the rapid implementation of Medicare and Medicaid exploded the status quo and stretched the gap beyond the visible horizon. There was no time for gradual, normal adjustment to the new situation — the demand for more service, as part of a cooperative program, was immediate.

The Forum provided a more than welcome opportunity for objective review and assessment, enabling participants to withdraw from the field of action and view recent developments in their proper perspective. The two-day sessions performed the extremely useful function of producing for key leaders, both volunteer and professional, a kaleidoscopic picture of homemaker-home health aide service across the country, in relationship to other community services and to the total needs of families and individuals. For some, this was a first chance to compare the job they were doing with what was being done in other communities.

At the conclusion of the Forum, a penetrating, thought-provoking summary was presented by Peter G. Meek, Executive Director of the National Health Council and Treasurer of the National Council for Homemaker Services.

Mr. Meek spoke for all participants when he gave top priority to "the need to explore further many of the matters that deeply concern us" . . . and when he suggested that a follow-up national conference be arranged for the purpose of hammering out a pattern for the orderly development of the service to meet the varied and expanding and insistent need for it.

Forum & Annual Meeting

"CURRENT REALITIES AND FUTURE OPPORTUNITIES FOR HOMEMAKER-HOME HEALTH AIDE SERVICE"

Thursday, May 4 **Hotel Biltmore**

8:30-9:30 A.M. — Registration	Fountain Court

GENERAL SESSION

9:30 A.M. - 12 Noon Grand Ballroom

Presiding: MRS. CLARKSON HILL
Chairman, NCHS Forum Committee

Speakers: MRS. JUAN T. TRIPPE
President, NCHS
"Goals of the Forum"

ELLEN WINSTON, Ph.D.

Manpower and Immigration. Manpower Report Number 4.

Manpower Administration, Washington, D.C. Office of Manpower Automation and Training
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Jul65 7p.

*IMMIGRANTS; *OCCUPATIONS; *FEDERAL LEGISLATION; *STATISTICAL DATA; EMPLOYMENT PATTERNS

For the period 1947 to 1964, 4.4 million immigrants entered the United States and two-thirds of these were non-quota immigrants. About 2.1 million of this total reported having occupational experience with the remainder being housewives, young persons, and retired people. The proportion of professional, technical, skilled, semiskilled, and unskilled has consistently been higher than the proportion of these classifications for the U.S. labor force. During the period 1954 to 1964, 150,000 immigrants in demand occupations entered the country due to preferential selection which were deemed to be in the national interest. Under proposed legislation, the quotas of all quota countries will be placed in a pool from which individuals of all quota countries, subject to certain family and occupation preferences, will be able to draw on a first-come first-serve basis. About 63,300 additional quota immigrants might be expected to enter due to pooling the quotas. It is estimated that 23,900 of these additional people would enter the labor market. (EM)

MANPOWER AND IMMIGRATION

The history of our country is inseparable from the history of the immigrants who have come to its shores. During every period of our history, the immigrant's contribution to our society has been invaluable, whether one considers our material wealth, our institutions or the ideas and values we live by.

Eight of the 56 signers of the Declaration of Independence were immigrants. Capitalists like Scotch-born Andrew Carnegie and French-born E. I. Du Pont helped lay the foundation for our present-day industrial society. Labor leaders like British-born Samuel Gompers and Russian-born Sidney Hillman were instrumental in raising the American worker to the high position he now occupies.

Innumerable musicians and artists coming from other lands have contributed to our culture. Thousands of scientists have provided innovations which ultimately have resulted in jobs for millions. Enrico Fermi, Albert Einstein, Igor Sikorsky, and Alexander Graham Bell are but a few of the immigrants whose pioneering developments are now providing jobs for countless numbers.

While the contributions of these individuals are outstanding, this country has also benefitted from the millions of lesser known immigrants who, since colonial days, have provided our labor force with needed skills. In the late 19th and early 20th century, the flow of immigrants satisfied the needs for unskilled and semiskilled labor in industries such as coal mining, steel, apparel, meat packing, and transportation. In more recent years, particularly since World War II, immigrants have helped meet our need for more highly educated and trained workers. About one out of every three postwar immigrant workers has had a professional or skilled occupation.

RECENT IMMIGRATION

Between 1947 and 1964, 4.4 million immigrants entered this country. (See table 1.) During 1964 about 290,000 immigrants entered.[1] About one-third were "quota" and two-thirds "nonquota" immigrants. Under the existing immigration laws, countries not in the Western Hemisphere are considered "quota countries." With certain exceptions, the ethnic distribution of immigrants allowed to enter this country each year from the quota area is related to the ethnic distribution of the population in this country in 1920.[2] Immigrants from the Americas are given nonquota status and can enter freely, as long as indications are that they will be financially self-sufficient.

Occupational distribution. Slightly under one-half, or 2.1 million, of the 4.4 million immigrants who entered this country between 1947 and 1964 were reported as having experience in some occupation. The remaining 2.3 million were primarily housewives, young persons, and retired people.

---

[1] Immigration data in this report are for fiscal years. U.S. labor force data are annual averages.

[2] Exempted from the quota are spouses and children of U.S. citizens, individuals admitted through special legislation and certain other groups. Asiatic immigration is subject to more stringent limitations than is that from Europe. Also Jamaica, Trinidad, and Tobago in the Caribbean are subject to quotas, even though they are Western Hemisphere countries.

[1] The occupational categories listed in this table are those which immigrants reported on their arrival in the United States. It was not possible, in a few instances, because of lack of sufficient occupational detail to make a precise match with the occupations which appear on the List of Currently Critical Occupations as determined by the Technical Committee on Critical Occupations of the U.S. Department of Labor. For this reason, totals are not shown.

SOURCE: 1959 through 1964: Annual Reports of the Immigration and Naturalization Service, U.S. Department of Justice; 1954 through 1958: Data furnished by the Immigration and Naturalization Service, U.S. Department of Justice.

About 16 percent, or almost 350,000, of the immigrants with occupations who entered between 1947 and 1964 were professional and technical workers whereas only about 10 percent of all persons employed in this country during this period were in these occupations. (See chart 1.) Nearly one out of every six immigrants in this postwar period was reported as a skilled worker compared with one out of eight for the U.S. labor force. The proportion in professional and technical work has been consistently higher for immigrants than for the U.S. labor force for every year since 1947. The pattern has been substantially the same for skilled workers. (See chart II.)

Semiskilled workers accounted for about 13 percent and unskilled laborers 10 percent of the immigrant group.[3] In the Nation as a whole, these groups averaged 19 and 6 percent, respectively, of the labor force during this 18-year period.

The occupational distribution of the post-World War II immigrants coincided with the needs of our economy and also reflected, to some degree, changes made in immigration policy. The Immigration and Nationality Act of 1952 gives first preference for admission to quota immigrants with "special skills or ability who would be substantially beneficial to the national economy, cultural interests, or welfare of the United States." This provision has been utilized primarily by immigrants from countries which usually use up their whole quota. Immigrants from countries not using their full quotas have usually not found it necessary to utilize this first preference provision.

Immigrants in shortage occupations. The potential contribution of immigrants to the Nation's work force is illustrated by the number of immigrants who enter with occupations similar to those classified as critical or those considered to be in short supply by the Technical Committee on Critical Occupations of the United States Department of Labor. These occupations are used by the Selective Service System in determining deferments in the national interest. From 1954 to 1964, over 150,000 immigrants in such critical occupational areas as engineering, physics, nursing, and tool-and-die making entered this country. (See table 2.)

During 1964, over 20,000 immigrants in critical occupations entered this country, with two out of every three professionals in this category. Over the past decade, the number of engineers

[3]Well over half of these lesser skilled workers entered this country from nonquota Western Hemisphere countries.

CHART I. OCCUPATION OF IMMIGRANTS AND EMPLOYED PERSONS IN UNITED STATES, 1947-64

SOURCE: Immigration data: Annual Reports of the Immigration and Naturalization Service, U.S. Department of Justice; U.S. Employment data: Manpower Report of the President, March 1965, U.S. Department of Labor.

CHART II. A HIGH PROPORTION OF IMMIGRANTS ARE PROFESSIONAL AND SKILLED WORKERS

(PERCENT OF WORKERS IN OCCUPATION, 1947-64)

SOURCE: Immigration data: Annual Reports of the Immigration and Naturalization Service, U.S. Department of Justice; U.S. Employment data: Manpower Report of the President, March 1965, U. S. Department of Labor.

entering this country annually increased from 2,391 to 3,660. Almost three times as many nurses (4,230 compared with 1,502) are now entering; over twice as many physicians and surgeons and three times as many teachers now find their way to our shores.

A recent Labor Department publication lists 71 occupations which have reflected a steady national demand for qualified workers.[4] This listing includes occupations such as nurse, draftsman, machinist, physician, and engineer. Many immigrants can qualify for these kinds of jobs and can help alleviate the shortages in these and dozens of other occupations.

More immigrant engineers entered this country during the past decade than were graduated from all our colleges and universities in 1964. Over 18,000 physicians and surgeons entered this country during the past decade.

The 4,000 nurses who enter this country every year help alleviate the shortage in this critical occupation. The many hundreds of chemists, physicists, and biologists are contributing their technical know-how to industry and government, in many cases being supported by the 2,000 technicians who enter the United States each year.

The immigration of these highly skilled workers also represents a substantial contribution to our economy because of the heavy economic investment in their education and training

[4] U.S. Department of Labor, Career Guide for Demand Occupations, 1965.

Table 3. Estimated Labor Force Changes Between 1964 and 1975, With and Without Immigration, by Age

[Millions]

Ages	With immigration	Without immigration	Difference due to immigration
Total, all ages	16.7	15.0	1.7
Under 25	6.6	6.2	.4
25 to 34	6.3	5.7	.6
35 to 44	-.9	-1.3	.4
45 and over	4.7	4.4	.3

made prior to their arrival in this country. It has been estimated, for example, that it costs $35,000 to rear a child and send him through college. On this basis, the professional workers on the "critically skilled" list who have entered this country since 1954 represent an investment by other nations of almost 3.5 billion dollars. The cost of sending through medical school the 18,424 physicians and surgeons who immigrated during this period, based on current estimates of over $30,000 per student, would have been well over half a billion dollars. The experience these doctors have acquired in their years of practice cannot, of course, be reduced to dollar terms, nor can their potential for future creativity in research and development.

Some immigrants initially have to take jobs which require less skill, education, or training than those in which they had worked in their native land. However, after overcoming problems such as language difficulties and licensing requirements and after gaining familiarity with the workings of our job market, they are better able to find employment which enables them to use their full potential. That immigrants are able to adapt to our economy is shown by the fact that the unemployment rate of all foreign-born workers in the United States is no higher than that of all other workers.

Age distribution. Over 35 percent of all immigrants in 1964 were in the prime working ages of 25 through 44, compared with 24 percent for the U.S. population as a whole. If the age distribution of immigrants does not change substantially and the total flow of immigration remains at its present level, almost 20 percent, or 1,000,000, of the increase in the number of workers in this age group during the 1964-75 period will be the direct result of immigration. These are the workers with the greatest potential to contribute to our society, a group that is highly educated and highly employable. (See table 3.)

Most importantly, immigrants will make a significant contribution to alleviating the expected shortage in the key working-age group—35 to 44—during the next decade. It is estimated that the number of workers in this age group will decline by 900,000 between 1964 and 1975. If there were no immigration, the decline would be 400,000 greater or 1,300,000. Workers in this age group represent a crucial group whose leadership, management know-how, and skills and experience are needed in our economy.

IMMIGRATION UNDER THE PROPOSED LEGISLATION

The principal purpose of the immigration legislation now being considered is to eliminate the national origins quota under which prospective immigrants from countries outside of the Western Hemisphere are judged, not by their personal qualities, but by their ethnic or national origin. Under the proposed legislation, the quotas of all quota countries will be placed in a pool from which individuals of all quota countries, subject to certain family and occupation preferences, will be able to draw on a first-come-first-serve basis. This provision will be implemented gradually over a 5-year period with a 20-percent annual cutback in each country's quota going into a general pool from which individuals from all countries may then draw. With a few exceptions, individuals of any single country may draw up to 10 percent of this pool.

At the present time, many countries, such as Italy and Greece, regularly use all their quota numbers while other countries, such as Great Britain and Ireland, do not. Thus, at the same time that many countries have long waiting lists of people desiring entry to this country, others let a large part of their quota go unused. In 1964, only 102,844 quota immigrants entered this country even though 158,161 quota numbers were available. The proposed legislation would remedy this situation. Since all the quota numbers would be in a common pool, Italians or Greeks, for example, could enter on the quota numbers the British do not need. Thus, under the proposed legislation, 63,300[5] additional quota immigrants might be expected to enter this country. (See table 4.) Only 7,300 of this increase, however, would be due to an increase in the quota itself. The remaining 56,000 increase would be the result of a better utilization of quota numbers currently available but not used.

[5]Excludes an estimated 5,000 refugees.

Table 4. Estimates of Quota Immigration Under the Current Law and the Proposed Law, by Occupation[1]

Quota immigrants	Average quota immigration under the current law	Anticipated quota immigration under the proposed law	Increases due to change in law
Total	97,500	160,800	63,300
With occupations	48,600	72,500	23,900
Professional, technical, and kindred workers	8,800	11,850	3,050
Farmers and farm managers	1,400	1,500	100
Managers, officials, and proprietors, except farm	1,900	2,650	750
Clerical and kindred workers	8,700	12,650	3,950
Sales workers	2,000	2,750	750
Craftsmen, foremen, and kindred workers	8,600	13,950	5,350
Operatives and kindred workers	5,900	8,800	2,900
Private household workers	2,300	3,650	1,350
Service workers, except private household	4,100	6,450	2,350
Farm laborers and foremen	1,600	3,050	1,450
Laborers, except farm and mine	3,300	5,200	1,900
Housewives, children, and persons with no occupation reported	48,900	88,300	39,400

[1] Estimates under the proposed law are for the immigration during the 5th year of operation; they do not include an estimated immigration of 5,000 refugees.

It is estimated that 23,900 of these additional 63,300 immigrants would enter the labor force,[6] with over half holding white-collar or craft jobs. Over 3,000 of these workers will have much needed professional experience.

Under the present legislation, an immigrant worker may enter under the "first preference" provision if an employer in this country certifies that he has a "special skill or ability" beneficial to our economy. Under the proposed legislation, these highly educated and trained workers would no longer have to find an employer in this country before they could come on a first preference basis. Thus, the admission of these people who would be highly advantageous to our society would be eased.

The proposed legislation would have no significant impact on immigration from nonquota countries and when the additional 23,900 workers from quota countries are compared with our expected 1970 labor force of 86,000,000, it is clear that the economic impact of the proposed legislation is exceedingly small.

As President Johnson said, "Over the years the ancestors of all of us have migrated to these shores." Immigrants have contributed mightily to this country's economic, social, and political development. In turn, these immigrants and their descendants have enabled succeeding generations to do likewise.

[6] The proportion of immigrants entering the labor force under this projection is somewhat smaller than has been true in recent years because more of the additional immigrants would be parents of resident aliens and others with relatively low labor force participation rates. Even if the proportion were to remain as high as it has been, the number entering the labor force would be no higher than 34,400.

Pub Date - Oct67 115p.

*EDUCATIONAL NEEDS; *MANPOWER NEEDS; *MANUFACTURING INDUSTRY; *METAL WORKING OCCUPATIONS; SKILLED OCCUPATIONS; SEMISKILLED OCCUPATIONS; OCCUPATIONAL SURVEYS
IOWA

The purpose of this study was to identify, by state wide survey, the training needs for skilled and semiskilled metal tradesmen in 11 job classifications. The population of the study was limited to 823 metal working manufacturing firms in the state of Iowa. The job descriptions presented on the questionnaires identified skills and abilities used by the workers in execution of the jobs. The 440 firms responding to the questionnaire employed a total of 23,763 metal tradesmen. The number of new workers employed in 1966 and the number of new workers which will be employed in 1968, as anticipated by the manufacturers, is nearly equal, while the need for replacement workers in 1968, 1970, and 1972 will be at a rate of approximately two-thirds of the number of trained new and replacement workers will be needed in the production machinist category. Employers expressed a desire to hire most of their new and replacement employees from those who will graduate from preparatory vocational-technical curriculums. Where there is an insufficient need to justify training in one district, districts should combine needs to provide a multi-district need and the training content for these programs and other programs should be developed by an advisory committee. TRAINING NEEDS FOR METAL TRADESMEN IN IOWA

A Summary of

A Study

Presented to

the Faculty of the Graduate School

University of Northern Iowa

In Partial Fulfillment

of the Requirements for the Degree

Master of Arts

by

Harlan E. Giese

October 1967

FOREWORD

This is a summary of a study undertaken to fulfill a two-fold purpose. It was initially designed to identify training needs for skilled and semi-skilled metal tradesmen. The results would provide information on which occupational training programs could be organized in local and area schools based on needs identified by industries in the state. This study was partially funded by the Research Coordinating Unit, Division of Vocational Education, Iowa Department of Public Instruction, Des Moines. The funding of this project is made possible under the provisions of Title 4A Public Law 88-210, The Vocational Education Act of 1963.

The second purpose of the study was to fulfill the thesis requirement for an M. A. Degree at the University of Northern Iowa, Cedar Falls.

ACKNOWLEDGEMENTS

The writer desires to express his gratitude to the numerous persons and organizations that provided a variety of services that made this study possible.

Mr. Donald Hauser, Administrative Assistant, Iowa Manufacturers Association, assisted by recommending names of key persons in Iowa industries who would be willing to review the questionnaire for this study prior to the general mailing.

Mr. J. Sid Craiger, Executive Vice-President, Iowa Manufacturers Association, assisted by writing the introductory letter that accompanied all of the initial mailings for this research.

Mr. Robert P. Schmidt, Editor, Business and Industry magazine assisted by printing a news article introducing this study to his readers. He also assisted by offering constructive criticism of the questionnaires used in this study.

Drs. Kenneth Wold and Donald Green of the Research Coordinating Unit, Division of Vocational Education, Iowa Department of Public Instruction, assisted by offering constructive criticism of the phrasing of questions used in the questionnaires.

Drs. Howard O. Reed, Lawrence S. Wright, Gordon Rhum, Cecil Phillips, Robert Johnson, and Mr. Willis Wagner of the University of Northern Iowa, Cedar Falls assisted with editorial comments on the questionnaires, this summary and the thesis.

The following industrial representatives reviewed the questionnaires and made valuable comments and suggestions for corrections:

Mr. Fred M. Chase, Director, Area Industry Development, Northern Natural Gas Company, Omaha, Nebraska

Mr. George Hall, Vice-President, Pittsburgh-Des Moines Steel Company, Des Moines, Iowa

Mr. Walter Brown, Executive Vice-President, Kiowa Corporation, Marshalltown, Iowa

Mr. Vernon Peters, Vice-President-Engineering, Viking Pump Company, Cedar Falls, Iowa

Mr. G. W. Yeager, Treasurer, Iowa Malleable Iron Company, Fairfield, Iowa

Mr. E. F. Scoutten, Vice-President-Personnel, Maytag Company, Newton, Iowa

Mr. J. R. Sickert, Vice-President, Murray Iron Works Company, Burlington, Iowa

CHAPTER I

THE PROBLEM AND DEFINITIONS OF TERMS USED

In 1965 the Iowa Legislature passed a law providing for the establishment of area vocational-technical schools and area community colleges. Both types of institutions are to offer in whole or in part vocational and technical curricula for the training of persons to enter employment. By March of 1967, fifteen groups of county and local school districts merged to form area community college and area vocational-technical school districts. Seven of the ninety-nine counties in Iowa did not support area schools at this time.

I. THE PROBLEM

Statement of the problem. The purpose of this study was to identify, by state-wide survey, the training needs for skilled and semi-skilled metal tradesmen in eleven job classifications. After the information was compiled and organized, it would be made available to area school administrators for their use in initiating occupational training programs.

Limitations of the study. This study was concerned with identification of training needs for skilled and semi-skilled metal tradesmen in the following eleven job classifications: assemblers, forge-press operators, hydraulic equipment mechanics, industrial equipment salesmen, machine repairmen (maintenance), machinist (custom) and (job shop), machinist (production), molder-foundry worker, patternmaker, tool and diemaker, and welder-combination. Blank forms were provided for the manufacturers to report anticipated needs in other job classifications.

The population of this study was limited to 823 metalworking manufacturing firms that are listed in the Iowa Development Commission Directory of

Manufacturers between the standard industrial classifications of thirty-three and thirty-seven inclusive. In addition 189 Iowa firms, outside the standard industrial classification above, but employing more than one hundred persons were sent questionnaires. It was assumed that many firms of this size employ personnel to maintain their production equipment and therefore may employ semi-skilled or skilled metal tradesmen.

The survey forms were sent to manufacturing concerns within the state of Iowa.

The findings of this study are summaries of information returned by responding firms. The questionnaires were answered by personnel directors, owners, business managers, or shop foremen.

The study was limited to the identification of training needs for certain occupations. The job descriptions presented on the questionnaires identified skills and abilities used by the worker in execution of his job. Additional study should be made to identify in greater detail the training content for each occupational category.

II. DEFINITIONS OF TERMS USED

The following terms are used in this study. They are included here to clarify their usage. Other terms will be defined when necessary within the body of the report.

Area Community College. "Area Community College" means a school offering the first two years of college work, vocational and technical training, and in-service training and retraining of workers.[1]

Area Vocational School. "Area vocational school" means a school offering vocational and technical training, and programs for in-service training and retraining of workers.[2]

---

[1] Iowa Legislature, 1965, Senate File 550.

[2] Ibid.

Merged area. "Merged area" means an area where two (2) or more county school systems or parts thereof merge resources to establish and operate a vocational school or community college.[3]

Metal tradesman. Any person who earns his livelihood by machining, forming, welding, molding, casting, forging, assembling, or selling metal parts or products.

Preparatory training. Occupational training programs usually pursued by the student who possesses little or no skill or technical knowledge of the subject at the time of enrollment. The student usually attends class and laboratory work a minimum of six hours per day, five days per week to receive training leading to his vocational goal.

> Semi-skilled worker. One who requires less training than the skilled worker. His work is specialized and often limited to one machine or a small area of the trade. His use of independent judgement is limited and he is under closer supervision than the skilled worker. High manipulative ability is a necessity.[4]
>
> Skilled worker. One who attains maximum productivity through a period of training usually more than two years in duration. He must have high manipulative ability. He must be able to exercise independent judgement and assume responsibility for the proper care and use of complex machines and the products produced.[5]

Standard Industrial Classification. A nationally-recognized numerical identification system classifying industries according to the products or services produced by the company.

Supplemental training. Occupationally oriented classes attended by an employed worker on a part-time basis. The worker receives training primarily in manipulative skills on-the-job. It is usually stated that he is

[5] Ibid., p. 6.

learning "how" to complete the job. The worker learns the "why" of his job through supplemental classes. Supplemental classes include apprenticeship-related instruction, journeymen-upgrading classes, and other occupationally related classes.

CHAPTER II

RELATED LITERATURE

Various materials were reviewed to secure information relating to this study. One group of studies pertained to procedures to be used when making labor market surveys. Outstanding in this group was the Handbook on Employment Security Job Market Research Methods.[6] Included in this publication were step by step procedures to be followed in making a labor market survey as well as helpful hints on receiving endorsement of the study by community groups. Pointers on the review of questionnaires prior to mailing and the follow-up procedures for those who do not return questionnaires were especially valuable. The Bureau of Employment Security also recommends procedures to be used in projecting future replacement needs where the employer did not feel able to estimate these needs.

The National Education Association also prepared a research memo entitled Studies of High School Graduates.[7] This publication was valuable for its contribution in terms of developing a schedule of mailing the questionnaires as well as recommending the tone of letters used to accompany the questionnaire.

In 1960 Robert Jacoby prepared a manual for the state of Pennsylvania pertaining to Trade and Technical Education Surveys.[8] This study enumerated sources for mailing lists and covered both student interest and industrial surveys. Jacoby also recommends elements to be included in the report following the survey.

CHAPTER III

THE METHOD OF PROCEDURE

INTRODUCTION

In reviewing the methods and techniques used in conducting this survey, reference will be made to sources of information on survey procedures. The topic headings are listed in the chronological order of the steps followed.

I. SELECTION OF THE POPULATION

This study was developed to identify the training needs for metal tradesmen on a state-wide as well as merged area school basis.

A map of the state of Iowa showing the geographical boundaries of each merged area district may be found on page 7. Since at the time of this study there were approximately seven counties not supporting a merged area school, four of these counties were attached to existing merged area schools for purposes of this study. Three counties were grouped as a merged area district. Crawford and Cherokee Counties were listed as part of Merged Area District XII. Carroll County was listed as part of Merged Area District V. Audubon and part of Guthrie County were listed as part of Merged Area District XIII. Jackson, Dubuque and Delaware Counties were listed as Merged Area District VIII.

Because of the variation in concentration and size of manufacturing firms across the State and the diversity of products produced, it was decided to survey all of the metalworking manufacturing firms in the State listed in the Directory of Iowa Manufacturers, published by the Iowa Development Commission. This Directory lists approximately ninety-six percent of all manufacturers in the State.[9]

---

[9]Iowa Development Commission, Directory of Iowa Manufacturers (Des Moines: Research Division, Sixth Edition, 1965), Procedures.

TABLE 1

AREA COMMUNITY COLLEGE AND VOCATIONAL SCHOOL DISTRICTS

It was anticipated that, for some of the occupations surveyed, there would not be sufficient need for trained workers in any one of the merged area districts. However, on a state-wide basis there may be sufficient need for a single or a small number of training programs. It seemed justifiable that this need be satisfied by the establishment of training in a merged area school district to meet the needs of the manufacturers elsewhere in the State.

The initial proposal for this research specified that all manufacturers listed in the Directory of Iowa Manufacturers in Standard Industrial Classifications 33 through 37 inclusive would be surveyed. Table II shows the type of product produced by firms found in each of the Standard Industrial Classifications 33 through 37 inclusive.

In addition firms employing one hundred or more persons outside of the Standard Industrial Classification 33 through 37 were surveyed since these firms may employ metal tradesmen to maintain their production equipment.

Because the number of firms listed in the classifications of 33 through 37 inclusive was 823, and the firms employing 100 or more persons numbered 189 it was decided to mail the survey form to the population.

TABLE II[10]

STANDARD INDUSTRIAL CLASSIFICATIONS

33	PRIMARY METAL INDUSTRIES
34	FABRICATED METAL PRODUCTS
35	MACHINERY EXCEPT ELECTRICAL
36	ELECTRICAL MACHINERY, EQUIPMENT AND SUPPLIES
37	TRANSPORTATION EQUIPMENT

II. DESIGN OF SURVEY PROCEDURE

The firms that were surveyed in this study were placed in two groups. One group was composed of the manufacturers who produced non-metallic products and who employed one hundred or more persons. The other group of manufacturers contained those who produced metal products.

---

[10] Iowa Development Commission, op. cit., p. 204.

III. SURVEY ELEMENTS COMMON TO BOTH GROUPS

Some efforts expended in organizing the survey were common to both groups of manufacturers.

One common element in surveying both groups of manufacturers was that of making the future respondents of questionnaires aware of the scope, methodology, and purpose of the study. The Bureau of Employment Security states that ". . . sufficient . . . publicity should be obtained to insure community awareness of the survey's importance."[11] The writer requested Mr. Robert B. Schmidt, Editor of Iowa Business and Industry to publish an article containing the type of information outlined above, about this study, in the October 1966 issue of that magazine.[12] A copy is located in the appendix, Exhibit 1. This periodical was selected because of its wide circulation (3,168) in Iowa to the management level of manufacturing firms.[13]

The mailing list. The next step was to obtain the names and addresses of the manufacturing firms to be covered by this study. This was accomplished by obtaining the magnetic tapes from which the Directory of Iowa Manufacturers was printed. The names and addresses were extracted from the magnetic tapes by computer. The computer was programmed to print-out the names within a space two and three-quarters of an inch wide and one inch high. When printed three columns wide and eleven rows high, this consumed a space on each print-out sheet of eight and one-half inches by eleven inches. It was then possible to reproduce gummed labels by using a heat type copying machine and the proper heat sensitive perforated, gummed label sheets. The cost of this process was much less than printing all needed gummed labels directly on the computer.

---

[11] Bureau of Employment Security, Handbook on Employment Security Job Market Research Methods, Area Skill Survey (Washington, U. S. Department of Labor, 1965), p. 10.

[12] "Metalworking Survey on Jobs, Skills, Begins", Iowa Business and Industry, (October, 1966), p. 22.

[13] Personal Conversation with Robert Schmidt, Editor, Iowa Business and Industry (Des Moines) March 27, 1967.

The computer was programmed so that if a given firm employed less than 100 persons the name of the owner of the firm preceded the name of the company. If the firm employed 100 or more persons, "Personnel Director" preceded the name of the firm.

The United States Department of Labor recommends this procedure.

> It is very important that the proper official(s) be contacted with respect to obtaining the necessary information for the survey. In many cases, this person will be a member of the firm's management since it is only at this level that future plans of the firm are known. If possible, contacts should be made with management, the personnel office, foremen, and other suitable sources.[14]

It was this writer's assumption that the smaller firms probably would not have a personnel officer. For this reason the survey instrument was mailed to the owner of the firm. Since most larger firms do have a personnel office, the survey instrument was mailed to their personnel director.

The covering letter. A second common element in conducting the survey for this study was that of obtaining an introductory letter from the Iowa Manufacturers Association endorsing the survey. The purpose of this letter was to notify and arouse interest. A copy of the letter may be found in the appendix, Exhibit 2.

Direction sheet. Space for directions on completing the questionnaires was not available on the forms. For this reason a separate direction sheet was developed which was included with each mailing of questionnaires. At the suggestion of Dr. Donald Green, cartoons were placed in the left margin of the direction sheet. The purpose of the cartoons was to attract the attention of the respondent and to motivate him to read the directions. A copy of the direction sheet may be found in the appendix, Exhibit 3.

---

[14] Bureau of Employment Security, loc. cit., p. 14.

IV. THE SURVEY TOOLS

It was decided that a higher percentage of returned questionnaires would be achieved if the metalworking manufacturers (SIC 33 to 77) were requested to complete inquiries about their training needs in job classifications presently found in their plant operations. While the Directory of Iowa Manufacturers lists the products produced by each manufacturer there is no listing of the manufacturing processes used to produce these products.

The post card. The initial questionnaire sent to the metalworking manufacturers was a post card asking them to check the manufacturing process(es) used in their plant. The responses on the post card included casting, machining, forming and forging, and welding. Based on the items checked on the return post cards, the manufacturers were then sent questionnaires which would apply only to their manufacturing operations. A copy of the post card appears in the appendix, Exhibit 4.

The covering letters. Included in the mailing of the post card was the letter from the Iowa Manufacturers Association which was described earlier. In addition this writer prepared a covering letter explaining the purpose of the study as well as its anticipated outcome. The article which appeared in Iowa Business and Industry was reprinted in the left margin of this letter. This was done to refresh the memory of the recipient, of this endorsement of the study. A copy of the letter may be found in the appendix, Exhibit 5.

The reminder. A reminder letter and second post card, identical to the first post card mailed, were mailed to those firms that did not respond within one week of the initial mailing. It was decided that a one week lapse of time was sufficient since the information requested could be placed on the card from memory and knowledge of the business. A copy of the reminder letter may be found in the appendix, Exhibit 6.

Sending the questionnaires. After the post cards were received by this writer, questionnaires were mailed to the manufacturers according to the manufacturing processes used in each firm.

A covering letter was prepared in which the manufacturer was reminded that he had recently returned a post card which was the first step in identifying state-wide training needs for skilled and semi-skilled metal tradesmen. He was also reminded of the scope and purpose of the survey. A copy of the letter may be found in the appendix, Exhibit 7.

Questionnaires were mailed for job classifications which could apply to the manufacturing process used. The manufacturers that stated that they made castings received questionnaires for Molder-Foundry Worker, Patternmaker, and Machinist (Production).

The reason for including the questionnaire on Machinist (Production) is that the job description included skills in the set-up and operation of die casting machines. This skill was included in the Machinist (Production) job description because this writer considered this more of a machine operation skill than a molder foundry-worker skill.

The manufacturers that used the process of forging and forming received questionnaires on Forge Press Operator and Machinist (Production). The reason for including the questionnaire bearing the job description of Machinist (Production) is that this description includes the skills of setting-up and operating brakes and punch presses. Some manufacturers may have correctly checked the forming and forging entry on the post card because they have punch presses in their plant operations. Punch press and brake work are considered to be forming processes.

The manufacturers that responded on the post card by indicating that they machined metals in their plant received questionnaires bearing the job descriptions for Machine Repairman - Maintenance (any industry), Machinist (Custom) (Job Shop), and Machinist (Production), and Tool and Die-Maker.

Those manufacturers who stated that they used welding processes in the production of their products or services received the questionnaire with the job description Welder, Combination.

The questionnaires not included in the above are ASSEMBLERS, HYDRAULIC-EQUIPMENT MECHANIC, and INDUSTRIAL EQUIPMENT SALESMAN.

It was not possible to identify specific industries that might employ persons possessing the skills outlined in these job classifications, therefore these questionnaires were included in the mailing to all manufacturers in the Standard Industrial Classification code 33 through 37.

The questionnaire for the HYDRAULIC EQUIPMENT MECHANIC was used because the greater use of hydraulics on machinery every year there may be a need for repairmen knowledgeable in this field. The growth in sales of hydraulic equipment can be used as an indicator of its importance in industry. In 1945, manufacturers of fluid power systems and components produced about one-third of a billion dollars worth of equipment. In 1957 these manufacturers produced five-hundred and twenty-four million dollars worth of equipment. With the increase in demand for fluid power equipment the per unit cost of components has been reduced.[15]

The questionnaire to determine the needs for ASSEMBLERS was developed because of clues provided by two manufacturers of construction equipment in Iowa. In 1965 this writer visited both manufacturing facilities. One firm employed less than 250 persons and the other firm employed less than 20 persons. This writer considered both firms low volume production operations. The products produced were assembled on an assembly floor as a complete unit. Assembly line methods typical of the automotive industry were not used. The operations performed by the assemblers appeared to fit the semi-skilled category. For this reason it appeared advisable to determine the training needs for this type of worker.

The questionnaire for Industrial Equipment Salesman was developed on the basis that some of Iowa's manufacturers employ their own sales force.

---

[15] National Fluid Power Association, "National Survey of the Availability of Manpower Trained in Fluid Power" (Thiensville, Wis: National Fluid Power Association, 1963), pp. 2,3. (Mimeographed).

This group of workers maintain contact with wholesale and retail sales organizations as well as directly with the consumer of the product. It would seem reasonable to assume that replacements and additional employees may be needed in this occupation. It also was apparent that in order to be an effective machinery salesman that they should receive instruction in mechanics as well as sales. For the above reasons this questionnaire was included in all mailings to Standard Industrial Classification firms 33 through 37. Samples of questionnaires can be found in the appendix, Exhibits 9 through 19.

V. SURVEYING FIRMS EMPLOYING MORE THAN ONE-HUNDRED PERSONS THAT ARE LISTED IN STANDARD INDUSTRIAL CATEGORIES OTHER THAN 33 THROUGH 37

This writer assumed that many large manufacturers or processors that do not fabricate metal products employ skilled or semi-skilled metal tradesmen to maintain their production machinery. All firms employing one-hundred or more persons listed in the Directory of Iowa Manufacturers in categories other than Standard Industrial Classification 33 through 37 were surveyed. Since the type of work performed by metal tradesmen in these firms would be of a maintenance nature the following questionnaires were sent to these manufacturers:

Hydraulic Equipment Mechanic
Machine Repairman, Maintenance (any industry)
Machinist (Custom) (Job Shop)
Welder, Combination

A covering letter was prepared and included with the questionnaires mailed to the above type of firm. A copy of this letter may be found in the appendix, Exhibit 8. The letter of endorsement by the Iowa Manufacturers Association, cited earlier, was included with this questionnaire mailing.

The inclusion of blank forms. All firms in this study also received two questionnaires which did not list a job description. The respondent was asked to complete the blank questionnaire for any job classification not

included in the packet in which he was experiencing a shortage of workers. A copy of the blank questionnaire may be found in the Appendix, Exhibit 20.

The reminder. All firms that did not respond to the initial mailing of the questionnaires within two weeks were sent reminder letters and a second set of questionnaires. Those manufacturers within Standard Industrial Classifications 33 through 37 were mailed a complete set of eleven prepared questionnaires and two blank questionnaires with their reminder letter. No effort was made to send questionnaires according to the manufacturing process used when mailing the reminder. The reason for this course of action was that all of the post cards that had been returned were categorized according to manufacturing process used and it would have been a time-consuming process to sort through the fourteen combinations of responses to locate the returned post card from the manufacturers that had not responded to the initial mailing of questionnaires.

Those manufacturers that employed more than 100 persons in Standard Industrial Classifications other than 33 through 37 were sent a reminder letter and a set of questionnaires identical to those included in the first mailing.

The reminder letter used for both groups of manufacturers was identical. The letter stressed the need for a response from each firm. A copy of this letter may be found in the Appendix, Exhibit 11.

THE QUESTIONNAIRES

The job description. Questionnaires were developed for eleven job classifications for which it appeared to this writer there would be demands for trained workers. The job descriptions do not match those found in publications, such as the Dictionary of Occupational Titles. The job classifications

are based on two factors. One factor is the observation of industrial work being done in selected manufacturing plants in the state. The other factor is an estimate by the writer of an adequate amount of identifiable content on which a preparatory vocational training program could be developed.

The questionnaires were sent to an advisory committee made up of key personnel in nine manufacturing firms located in Iowa. These persons were recommended by Mr. Don Hauser of the Iowa Manufacturers Association. Seven of the nine persons responded and reacted to the questionnaires. The questionnaires were then revised to reflect the constructive criticisms of these persons. The manufacturers who assisted with this are recognized in the ACKNOWLEDGEMENTS. Most of the reactions provided by this group pertained to the job descriptions on the questionnaires.

The questions. It was decided that since certain information would be required for each of the eleven occupations being surveyed that all questions on the forms would be identical. The only deviation from this in each of the eleven job classifications can be found in question 8. This question pertained to needs for supplemental classes. Since the duties in each job classification are different, it is reasonable that titles for supplemental classes vary according to the job description.

Since all questions, except number eight, were identical the reader may wish to consult Exhibit 9 to review the items of interrogation. The job descriptions used are listed in Exhibit 10. Question eight and possible responses are listed in Exhibit 11.

Since all questions, with the exception of 8, are identical there appeared to be the possibility that the respondent might discard a number of questionnaires after answering one or two, assuming that duplicate questionnaires had been mailed. For this reason the questionnaires were printed on six different colors of paper. This would call to the attention of the respondent a difference in the questionnaire.

CHAPTER IV

I. FINDINGS OF THE STUDY

The initial survey instruments were mailed during the first week in January of 1967. Procedures followed in the mailing are outlined in the preceding chapter. The last responses were received on February 10, 1967.

Responses to the questionnaires. The total population of this study included 1,012 firms located in the state of Iowa. A total of 440, or 43.6 percent, responded to the questionnaires. The responses by Merged Area District ranged from a low of 25.9 percent in Merged Area District XIV to a high of 61.5 percent in Merged Area District III. Table III provides number and percent responses from all Merged Area Districts as well as the State.

Of the firms classed as metalworking manufacturers (SIC 33 through 37) in the State, 80 percent returned the post card questionnaire. The Merged Area District with the highest response was XV with a percentage of 93 while the lowest was Merged Area I with a percentage of 66.7.

Forty-one and nine tenths percent of all of the metalworking manufacturers returned questionnaires or slightly more than one-half of those that returned post cards. Sixty percent of the manufacturers in Merged Area District IV returned questionnaires. This was the largest percentage of return. The lowest percentage of return of questionnaires by firms occurred in Merged Area District XIV. The return equaled 28 percent. The largest number of metalworking manufacturers are located in Merged Area XI while the smallest number of this type of firm is located in Area IV. Table IV provides details about responses of firms within other Merged Area Districts.

The firms outside of Standard Industrial Classifications 33 through 37 employing 100 or more persons demonstrated greater interest in the study by returning 49.7 percent of the questionnaire. All firms in this category

located in Merged Area District III responded. None of the firms in Merged Area Districts XIII and XIV responded. The median response from all firms in this category was 47.2 percent. Table V provides detailed information on number and percent of responses by firms within each Merged Area District.

Processes used in manufacturing. As mentioned earlier, post cards were mailed to the metalworking manufacturers requesting them to report the manufacturing process(es) used in their firm. The four processes listed on the post card were casting, forging and forming, machining, and welding. There were 16 possible combinations of responses to the questionnaire. Of the 658 firms that responded, the combined processes of machining and welding were used most predominantly. One hundred and sixty-seven manufacturing firms used these processes. The one single process used least in the State was forming and forging. Sixteen firms used that process alone. Table VI shows the tabulation of the 658 firms by Merged Area District and state-wide totals with respect to the process(es) used.

II STATE - WIDE NEEDS

State-wide patterns by occupation. The respondents were asked to indicate whether they would employ graduates of vocational technical programs to fill the anticipated vacancies they would have in each job classification in 1968, 1970, and 1972. If the response was "yes" the need for workers was tabulated in a column in Table VII entitled New Employees Needed by Institutional Training. Replacement needs are tabulated in the following columns of the same table.

Institutional training. Table VII shows the state-wide needs for new and replacement skilled and semi-skilled workers in the eleven occupations surveyed. In addition employment patterns in the occupations surveyed are shown.

Employment patterns. The 440 firms responding employed a total of 23,763 metal tradesmen. The largest employment occurred in the job classification Machinist (Production), with a total employment of 8,947. The second highest employment occurred in the occupation Welder-Combination with the level at 2900.

Often a labor market analyst will study replacement rates and other factors about occupations and draw conclusions about the labor force, working conditions, and organized labor. This study was limited to identifying needs as expressed by employees. No effort will be made to analyze data based on replacement records of the populations. Table VII shows the replacement rates in the eleven occupations surveyed with percentages computed in the last column.

State-wide needs. The number of new workers employed in 1966 and the number of new workers which will be employed in 1968, as anticipated by the

manufacturers, is nearly equal. From this information one can conclude that manufacturers anticipate continued national economic growth and increasing demand for their products.

The need for replacement workers in 1968, 1970, and 1972 will be at a rate of approximately two-thirds of the number required in 1966.

The largest number of trained new and replacement workers will be needed in the Production Machinist category in 1968, 1970, and 1972. Second to this is the need for Moulder-Foundry Workers and ranking third is the need for Assemblers. The occupations Patternmaker and Forge Press Operator will require the least number of workers trained.

Geographic representation of state-wide needs. Tables number X through XX show needs for trained workers by Merged Area District. Some individual Merged Area Districts will not be able to justify the establishment of certain occupational training programs covered in this study. Tables X through XX show needs geographically by Merged Area Districts as well as state-wide needs. These tables illustrate that in certain occupations, manufacturers in adjacent Merged Area Districts report sufficient need to justify an occupational training program. Where this occurs the administration and boards of the adjacent Merged Area Districts should meet to decide which Merged Area District should offer the program. The Merged Area District in which there is greatest need should initiate the multi-merged area district meeting.

State-wide needs in other occupations. The employers responding to this survey had the opportunity to indicate occupations in which they were experiencing shortages in skilled workers outside of the eleven they were specifically requested to answer. Many firms did this to the degree that 19 occupations were represented which were different from those initially surveyed. Table IX lists these occupations and the number of workers required on a state-wide basis for the next six years.

On-the-job training. Item six of the questionnaire used in this survey asked the respondent, "For positions in this job classification, would you hire graduates of vocational-technical programs possessing the skills listed above?"

The needs as expressed by those firms that answered NO to item six were tabulated as requiring on-the-job training. The respondent had the opportunity to elaborate in item seven, the method that would be used to fill needs if NO had been checked in item six. The choices in item seven included two which were variations of on-the-job training, one of hiring skilled workers from other firms, and "other". The number of responses indicating "other" and "hiring from other firms" were very small in number. For this reason all NO responses in item six were considered, "on-the-job training," in this study. The reader should realize that a YES response in item six did not imply that only graduates of vocational-technical programs would be employed to fill job vacancies. Many firms will undoubtedly continue to utilize their on-the-job training programs to fill job vacancies. However, if vocational-technical curriculum graduates are available they would be given the opportunity for employment in 440 firms in the State.

The greatest need for persons to be trained in the eleven occupations, through on-the-job training, is in the occupation of Assemblers. The occupation of Welding ranked second. Complete details on state-wide requirements for workers in eleven occupations are contained in Table XXI.

Occupations in which workers would be trained through on-the-job training in job classifications other than the eleven specifically included in this survey are listed in Table XXII. The greatest need expressed by employers was for packinghouse workers followed by the need for sheetmetal workers.

III. NEEDS BY MERGED AREA DISTRICT

Vocational training. Tables XXIII through XXXVIII show employment patterns and new and replacement worker needs in the eleven occupations reported by industries in each Merged Area District. When analyzing the needs as reported in this summary it would be advisable that school administrators consider the replacement record in relation to total employment in the occupation during 1966. A high percentage of replacement may indicate further study is necessary on the part of local and area school officials before establishing a training program for an occupation in which there has been a record of high turn-over of personnel. Replacement rates computed on a state-wide basis may be found in Table VII.

When school officials consider the establishment of a training program, the need for workers in that occupation should be at least thirty annually before a program is established. This will provide for two classes to be offered in the same facility each day. Each class would then have the opportunity to use the shop facilities for five hours and also have the same facility available for part-time supplementary training. In some cases Merged Area Districts will need to combine needs to make efficient use of one shop facility in one of the Merged Area Districts. When training can be accomplished in a period of six months or less the number used above will need to be doubled in order to maker year around use of the facility.

Supplemental training. Each responding industry was asked to estimate the number of employees they felt should be enrolled in part-time supplemental classes. These estimations are listed in Tables XXXIX through LIV. A tabulation of need for supplemental classes follow the tables showing employment patterns and preparatory training needs in each Merged Area District. These needs are shown by occupation. The reason for this is that, for instance,

the blueprint reading course content for a Machinst (Production) would be entirely different from the blueprint reading course content for a Welder. Instructor competencies would be different for each class also.

There will be a listing of need for trained workers in each Merged Area District in occupations not included in the eleven occupations surveyed by standard questionnaire. These needs will be shown for the six year period projection since, in the majority of cases, the needs are small.

Merged area needs in other occupations. The employers responding to this survey had the opportunity to report occupations in which they were experiencing shortages in skilled workers beside the eleven for which they were specifically requested to respond. Many firms capitalized on this opportunity. Tables LV through LXX report these occupations and the need for trained workers by Merged Area District for the six year period from 1968 through 1972. These needs are shown for a six year projection period since, in the majority of cases, the needs are small.

CHAPTER V

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

This chapter consists of the restatement of summations made earlier in this paper as well as conclusions drawn from selected tables. Recommendations are based on the findings of the study.

I. SUMMARY

Scope of the study. The study involved surveying by mail 823 metalworking manufacturing firms in Iowa plus 189 firms not classed as metalworking manufacturers that employed 100 or more persons. The number of firms included in the survey represented the total number listed in the Directory of Iowa Manufacturers[17] in each classification. The population of this study involved 1012 firms. Four hundred and forty firms or 45.6% returned questionnaires. This study requested information from the industrial firms about eleven job classifications which included number of workers employed, number of positions closed, number of new positions, and number of replacement workers employed during 1966. In addition, the firms surveyed were requested to estimate their needs for new and replacement workers in 1968, 1970 and 1972 and specify how they would prefer to fill these needs. A third major phase of this study included responses to a question which identified needs for part-time classes to upgrade workers presently employed in the occupations surveyed.

Two blank questionnaire forms were sent to each firm which were to be completed for any job classification, other than the eleven specifically surveyed, in which the firm was experiencing a shortage of skilled help.

---

[17] Iowa Development Commission, loc. cit.

Method of the study. Data processing equipment was used to extract names and addresses of firms included in the study. Questionnaires were mailed to the firms. A maximum of one reminder was sent to firms not responding to the mailing of the questionnaire. Data processing equipment was also used to compile all data except for those not included in the eleven metalworking occupations. Responses were received on blank questionnaire forms for approximately 22 additional job classifications.

II. CONCLUSIONS

Employers responding to the questionnaires expressed desire to hire most of their new and replacement employees from those who will graduate from preparatory vocational-technical curricula. The need for new and replacement employees in 1968, 1970 and 1972 is nearly equal, in all eleven occupations, to the number the firms employed in 1966. Since only limited vocational and technical training was available in 1966 from which vocational graduates could be employed, one might conclude that the 440 firms in Iowa feel that public education should provide more occupational education. These 440 firms will need 3,560 metal tradesmen trained annually in the eleven occupations included in this survey. The greatest need for training occurs in the Machinist (Production) category and in the Molder-Foundry Worker category.

The number of positions closed in each of the eleven job classifications during 1966 ranged from 0% to 1.5%. In all cases it appeared that in Iowa the number of job closures was insignificant.

Needs as identified in Tables XXXIX through LIV for supplemental classes are greater than are being satisfied by area and local schools in the State at the present time. Some of the less populous merged areas show less need for supplemental classes. Efforts will need to be expanded to broaden

the offering of part-time supplemental classes. This might be accomplished by area schools employing persons with a broad industrial background to work with industry in developing classes.

III. RECOMMENDATIONS

The following recommendations, based on the findings of this study, appear to be appropriate for the improvement of the industrial climate in Iowa.

1. Where a Merged Area District finds insufficient need to justify economically offering a particular type of training to develop skilled and semi-skilled metal tradesmen the administrators and board should study Tables X through XX. Adjacent Merged Area Districts should combine needs so that one Merged Area District will provide training based on multi-merged area district need.

2. Training content for preparatory vocational programs should be developed by an advisory committee made up of equal representation of key workers employed in the occupation and foremen of workers in the occupation. The job descriptions used in this study were approved by a group of knowledgeable industrialists. Some variation from these job descriptions may be needed to tailor the training content to the needs of manufacturers in the Merged Area District. School administrators and boards should not misconstrue the preceding statement, however, to mean that one can train a person to set-up a multiple spindle automatic screw machine by using an engine lathe for training.

3. Additional State, Federal and Area funds will need to be expended in order to expand present offerings so that the industrial training needs of the State may be met. Once facilities are equipped it will be necessary to schedule multiple shifts for training in order to make efficient use of the equipment and facilities.

4. Further research should be done to more accurately determine the state-wide and area-wide training needs in the twenty, plus, occupations listed in Table IX and Tables LV through LXX. Needs reported in this study would provide justification for a limited number of training programs in each occupation. A study including each of these occupations may uncover a greater need.

5. Expanded offerings of part-time supplemental classes should occur in most areas of Iowa. Based on findings of this study some area schools should employ personnel competent in industrial education to work with industry in developing and implementing part-time supplemental classes.

6. Part-time supplemental classes should be offered during any hour of the day when persons are available for this training and sufficient interest is shown through enrollment.

7. An extensive advertising program should be developed with the cooperation of industrial management and organized labor to encourage enrollment in supplemental training. Some industries may wish to implement a tuition refund plan to encourage workers to upgrade themselves.

8. Some Merged Area Districts do not have sufficient industrial development to serve all workers and industries in their Merged Area District. More industrialized Merged Area Districts should organize short duration, full-time workshops to provide supplemental training for employees from industries located in other Merged Area Districts.

APPENDIX

EXHIBIT 1

Metalworking Survey on Jobs, Skills Begins

Manpower and specialized training needs for Iowa metalworking industries will be inventoried in a survey beginning this month among 995 metalworking manufacturers and 330 other Iowa industries employing 101 or more.

The survey is being conducted by Harlan E. Giese, state consultant, Trade and Industrial Education, Division of Vocational Education, Department of Public Instruction.

Cooperating in the survey are the Iowa Department of Public Instruction, Iowa Manufacturers Association, Business & Industry magazine and State College of Iowa, Cedar Falls.

The purpose of the survey will be to determine present and future educational needs for new and veteran metalworking employees. The results will enable the 16 new area vocational-technical schools and community colleges to provide occupational training to meet employment demands in metal fabrication occupations.

Metalworking and large industries will receive two mail pieces in the survey. The first will be a postcard seeking information on industrial usage of four fabrication processes: casting, welding, machining and forming and forging. A more detailed questionnaire will follow asking specifics on 11 skilled or semi-skilled occupations. These include welders, machinists (custom), machinists (production), patternmakers, molders and foundry workers, tool and diemakers, machinery repairmen, forging operators, hydraulic equipment mechanics, assemblers and industrial equipment sales.

The study will provide information on what types of occupations are in short supply, what basic training is required and what retraining or upgrading is needed.

November 21, 1966

Dear Manufacturer:

Presently most Iowa manufacturers are experiencing shortages of skilled and semi-skilled workers in many occupations.

Training to be established in the area vocational-technical schools and community colleges now in the process of being organized should help alleviate some of these labor market shortages.

Mr. Harlan Giese of the Iowa Department of Public Instruction is conducting a survey to determine the training needs for skilled and semi-skilled metal tradesmen in Iowa. The findings of this survey will ascertain the need on which occupational training classes may be established in communities across the state.

We heartily endorse this survey and would encourage you to take the time to complete the short questionnaires to follow.

Sincerely,

J. S. Craiger

Executive Vice President

EXHIBIT 3

A FEW DIRECTIONS

Multi-Plant Operations - If you are answering for one of Iowa's manufacturers that has plants located in several cities in the state, answer the following questionnaires for your specific plant location only.

Insufficient or Confusing Information - If the questions on these questionnaires are phrased in such a way that you think your response may be confusing or you are not allowed to provide enough information, please feel free to write needed comments on the reverse side of the questionnaire.

Shortage Occupations Not Covered - In the event you are experiencing shortages of skilled or semi-skilled metal tradesmen in job classifications not covered in the questionnaires enclosed, use the blank white forms to provide information on these occupations. Be sure to provide title of job at top of form. Write a description of the responsibilities or skills of the worker on the lines provided.

Definitions

Estimate - Certain questions use phrases like ESTIMATE your needs, etc.....Do so in terms of present economic conditions. We are not asking you to predict the future.

New Positions - means positions added because of new products, increased sales, etc.....Where estimating new positions for which you will employ workers assume that economic conditions will remain as they are today.

Replacement - means the hiring of new workers for existing jobs that have been vacated due to death, retirement, firing or quitting.

Exhibit 4

Which of the following process(es) are, or will be used by your firm to manufacture the products or services you sell?

_____ Casting _____ Machining

_____ Forming & Forging _____ Welding

Your Name _____

Metalworking Survey on Jobs, Skills Begins

Manpower and specialized training needs for Iowa metalworking industries will be inventoried in a survey beginning this month among 995 metalworking manufacturers and 330 other Iowa industries employing 101 or more.

The survey is being conducted by Harlan E. Giese, state consultant, Trade and Industrial Education, Division of Vocational Education, Department of Public Instruction.

Cooperating in the survey are the Iowa Department of Public Instruction, Iowa Manufacturers Association, Business & Industry magazine and State College of Iowa, Cedar Falls.

The purpose of the survey will be to determine present and future educational needs for new and veteran metalworking employees. The results will enable the 16 new area vocational-technical schools and community colleges to provide occupational training to meet employment demands in metal fabrication occupations.

Metalworking and large industries will receive two mail pieces in the survey. The first will be a postcard seeking information on industrial usage of four fabrication processes: casting, welding, machining and forming and forging. A more detailed questionnaire will follow asking specifics on 11 skilled or semi-skilled occupations. These include welders, machinists (custom), machinists (production), patternmakers, molders and foundry workers, tool and diemakers, machinery repairmen, forging operators, hydraulic equipment mechanics, assemblers and industrial equipment sales.

The study will provide information on what types of occupations are in short supply, what basic training is required and what retraining or upgrading is needed.

Dear Personnel Director:

You have an opportunity to help solve the manpower shortage of metal tradesmen in Iowa.

The article at the left appeared in the October issue of Iowa Business and Industry. That magazine and the Iowa Manufacturer's Association are cooperating with the State College of Iowa and the Iowa Department of Public Instruction in conducting a survey to determine the training needs for skilled and semi-skilled metal tradesmen.

The results of the survey will provide valuable information which will serve as a guide in the establishment of occupational training programs. Needed occupational training programs will be established in the new area vocational-technical schools or area community colleges in Iowa.

Industries responding to the enclosed questionnaires will be provided a summary of this state-wide survey. This will give you information about twelve occupational classifications of metal tradesmen. These survey summaries will also be provided to area school administrators, representatives of the Bureau of Apprenticeship and Training, Iowa State Employment Service, and any other interested persons or organizations.

This survey should be of real value to you! We need a 100% return. Please do your part by completing and mailing the enclosed simple forms.

Sincerely,

Harlan E. Giese

Dear Manufacturer:

One week ago a letter and reply post card were mailed to you which provided an opportunity for you to assist in solving your manpower shortages.

You may have misplaced this letter since we have not received your completed reply post card. We are including a second card with this letter.

This card is part of a survey which will eventually guide the vocational director in your area vocational-technical school or community college in establishing occupational training programs to serve your needs.

Now is the time to provide confidential information for a future solution to your manpower and training problems. Invest a few seconds now in an effort to alleviate some of your problems.

Sincerely,

Harlan E. Giese

November 21, 1966

Dear Sir:

The article to the left appeared in the October issue of Iowa Business and Industry.

This article tells of a labor market survey. The findings of this survey will be used to guide area school administrators in establishing occupational training programs for skilled and semi-skilled metal tradesmen. These training programs will help provide a reservoir of trained persons with metalworking skills for your manufacturing operations.

In addition, the findings of this survey will be used to strategically locate supplimental classes to upgrade your presently employed workers.

The first step in gathering this information is for you to complete and mail the enclosed post card. After we receive the enclosed post card, questionnaires will be sent to you which will pertain specifically to your manufacturing operations. You will not be bothered with unnecessary questions. The questionnaires have been reviewed by a group of well known Iowa industrialists. The questionnaires have been modified according to their recommendations.

Take the first step now in solving your labor shortages by completing the enclosed card and placing it in the mail today.

Sincerely,

Harlan E. Giese

ASSEMBLERS

Assembles machinery from blueprints and other specifications by locating frames and main sections in assembly area. Positions gears, aligns shafts, installs bearings and clutches. Installs electric motors or gasoline engines, and hydraulic equipment. Fastens with bolts and installs piping, hoses and wires. Uses hoists, hand tools, torque wrenches, calipers, feeler gauges, rulers and squares to complete work.

FORGE PRESS OPERATOR

Sets up and operates closed die power presses according to specifications using hand tools and measuring instruments. Sets dies on ram and anvil using squares, shims, feelers and hand tools. Adjusts pressure of press. Heats stock and places on dies with tongs. Compresses metal by release of ram with foot treadle.

HYDRAULIC EQUIPMENT MECHANIC

Installs, tests, adjusts and repairs hydraulic units and systems following blueprints, schematic drawings, or verbal or written instructions. Uses test panels, supplementary equipment and electrical meters to check operation of hydraulic system and electrical and electronic controls. Identifies cause of malfunctions and makes necessary repairs.

INDUSTRIAL EQUIPMENT SALESMAN

Sells mechanical or electrical equipment, supplies or services which require technical knowledge. Makes judgements involving mechanical, electrical or economic principles and calculations. Persuades potential buyers or leasees of practical value of an item or service. Prepares financial and operational estimates from blueprints, plans or other information supplied by potential customers.

MACHINE REPAIRMAN, MAINTENANCE (any industry)

Repairs and maintains production machinery such as lathes, drill presses, milling and screw machines, conveyors and other machinery; realigns spindles, adjusts clutches, replaces bearings, and welds broken parts. Diagnoses and repairs hydraulic and electrical problems. Welds and/or machines replacement parts. May set up new machinery for operation.

MACHINIST (CUSTOM) (JOB SHOP)

Sets up and operates machine tools such as engine lathe horizontal and vertical milling machines, shaper, planer and grinder. Machines parts from blueprints, defective parts, or other specifications. Heat treats parts where necessary and uses handbooks. Uses hand tools and precision measuring instruments. May use welding processes to fabricate or repair items.

MACHINIST (Production)

Sets up and operates screw machines, die casting machines, turret lathes, broaching machines, production milling machines, brakes and punch presses, drill presses, grinders, gear cutting machines, and other metalworking machinery. Installs cutting tools, die sets, gears and cams. Completes set-ups according to part prints, job tickets and verbal directions. Produces proper number of parts. Feeds stock to machines.

MOLDER-FOUNDRY WORKER

Forms sand molds for metal castings. Charges furnaces and melts ferrous and non-ferrous metals. Reconditions cupolas, furnaces and ladles. Positions wire reinforcing, applies parting compounds, cuts runners and sprues. Cleans, chips and grinds the castings.

PATTERNMAKER

Builds and repairs foundry patterns, core boxes, and match plates, made of wood, plaster, metal and plastic. Completes layout of parts on rough stock and makes allowances for metal shrinkage. Sets up and operates wood and metal-working machine tools. Builds up and reinforces plaster or plastic molds. Uses hand tools to finish wood, metal or plastic patterns. Uses templates and measuring instruments to check pattern configuration. Casts metal pattern in plastic or sand cavity.

TOOL AND DIE MAKER

Builds punch press cutting and forming dies, milling and clamping fixtures, drill jigs, gauges and weld fixtures. Uses hand tools and precision instruments to layout work from blueprints and specifications. Machines component parts on engine lathes, milling machines, drill presses, shapers and planers, jig boring machines, and grinders. Heat treats to specifications. Uses handbooks as references to complete work.

WELDER COMBINATION

Joins metal parts by use of all gas and electric welding processes. Grinds and cuts metal. Uses blueprints and work orders to make layout, and fabricate items. Repairs broken or worn metal parts.

Exhibit 11

8. Assuming that the following evening classes were offered in or near your community, how many of your present work force in this job classification should attend to upgrade their skills and technical knowledge? (give number)

Dear Manufacturer:

About two weeks ago you received a series of questionnaires to determine what your employment needs will be for skilled and semi-skilled metal tradesmen. To date we have not received your completed questionnaires.

Possibly you feel that this is another effort to gather information which will only be placed in some file and not be used. This is not the case. The information from this survey will be disseminated to agencies that are organized to provide training to meet your employment demands. You will also receive a copy of the findings from this survey if we receive your completed questionnaires. The summary of the findings from this research will show demands for skilled and semi-skilled metal tradesmen in your section of the state and for the state as a whole.

Naturally the degree of accuracy of this study is dependent on the number of manufacturers that respond by returning their questionnaires. Since you have not responded, the training needs in your geographic area will be biased. It may even inhibit the establishment of training programs.

Your response is important. Be sure to complete the enclosed questionnaires and mail today.

Sincerely,

Harlan E. Giese

*INDUSTRIAL ARTS; *GENERAL EDUCATION; *STUDENT DEVELOPMENT; *SKILL DEVELOPMENT; *EDUCATIONAL OBJECTIVES

Certain fundamental skills are needed by everyone who aspires to become a truly educated man and to find the place or job in which he can be most effective. The skills which are needed by the liberally educated person of tomorrow are the skills of (1) being flexible, (2) being creative, (3) making wise choices, (4) learning to know one's self, (5) understanding others, and (6) knowing how to learn. Education for flexibility should include the application of broad principles and not narrow mechanistic operations. While creativity as a skill probably cannot be taught, we can at least provide an environment in which it can be developed. Discerning teachers can advise and encourage, help analyze decisions which have been made, and provide opportunities for decision making. The importance of self knowledge is self evident and its attainment must be the concern of teachers. Understanding of others should imply not only comprehension but also tolerance, sympathy, and indulgence, and it should be used to eliminate decisions and action based on bias, prejudice, hatred, and ignorance. Learning how to learn should stem from self-educative experiences and teacher models. Senior high industrial arts programs in the future should have three emphases, i.e., preprofessional, pretechnical, and individual curriculums. (EM)

by EARL M. WEBER

President

AMERICAN INDUSTRIAL ARTS ASSOCIATION

Earl M. Weber

Dr. Earl M. Weber is President of the American Industrial Arts Association and Director of Industrial Arts Education, Millersville State College, Millersville, Pennsylvania. He was formerly Editor of *The Industrial Arts Teacher* and Director of AIAA Publications.

The Role of Industrial Arts in Tomorrow's Schools discusses industrial arts as imperative to the student's development for flexibility, creativity, making wise choices, and in learning to know one's self in relation to others.

Anyone who in the second half of the twentieth century has the audacity to restate that very tired phrase that "industrial arts is general education" ought probably to be run out of town. Nevertheless, let's examine this tired old idea and find out, if we can, what's wrong with it. Now I am not going to try to define *general education* for you—this has been done too many times and you can have your pick of a dozen different definitions. Let me simply state here that the current vogue of substituting the word *liberal* is equally bootless. Whether in politics or education this word "liberal" has lost all power and anyone can use it to express his own special meaning, with very little chance that he will convey that same meaning to others. So it is of no use to us to substitute *liberal* for "general" in our discussion.

It isn't in particularly good taste to define a concept in negative terms, but I think we will understand each other if I speak of two kinds of education: Vocational and non-vocational. I am using these words in a generic sense with no bias or prejudice intended. There is nothing inherent in the words that implies federal aid or Smith Hughes Act or trade and industrial training. Vocational education is simply teaching people those things—skills and ideas—that will aid them in earning a living and this is the avowed and foremost purpose of vocational education. What I have for our purposes dubbed "non-vocational education" (and you may substitute general or liberal or anything else you wish) is education which is intended to have people learn *how to live.*

Not how to earn a living but how to live. How to live! How to live more effectively; how to find more meaning in life; how to come closer to living what has been called the "full life." Of course, at this point one has to decide what kind of education will enable a person to find this full life. What should be the outcomes of a general or liberal or non-vocational education? What is it that a liberally educated person ought to know *and be able to do?* If a person has read the classics, has a smattering of two or three foreign languages, plus an assortment of courses in the sciences, social sciences, and mathematics, he is then supposed to have what is commonly called a liberal education. In contrast, if a person has learned certain skills (saleable skills they are sometimes called) such as typing, or cosmetology, or auto repair, or cooking, or teaching, or the practice of law or medicine, then he is said to have a vocational or a professional education and is presumably prepared to earn a living by practicing these learned skills.

From this one might conclude that the difference between a vocational and a non-vocational education is determined by whether or not any skills are developed. It would appear to me that such a differentiation is too narrow.

Regarding the non-vocational or *general* education—we are still faced with the question "general education for what?" The main point of my thesis today is that certain fundamental skills are needed by everyone who aspires to become a truly educated man and to find the place or job in which he can be most effective. Let me hasten to add that I am not talking about such pedestrian skills as knowing how to hammer a nail straight or repairing a worn out washer in a leaky faucet—(new faucets don't have washers in them anymore)—Too often we in industrial arts have attempted to put our foundations on this kind of sand. The skills which are needed for the liberally educated person of tomorrow are, I believe:

1. The skill of being flexible
2. The skill of being creative
3. The skill of making wise choices
4. The skill of learning to know one's self
5. The skill of understanding others
6. The skill of knowing how to learn.

These skills have of course always been important. They are important today and they will become increasingly and vitally important to the citizen of tomorrow. I shall discuss very briefly what I mean by each of these six skills.

THE SKILL OF BECOMING FLEXIBLE

Over 500 years before Christ, the Greek philosopher Heraclitus said, "You cannot step twice into the same river," and ever since we

The truly educated man must be flexible, creative, imaginative, and must have sufficient background for making wise choices. The industrial arts classroom can provide the incentive and the opportunity for developing the individual's powers of imagination.

Photo by NEA—Carl Purcell

have been reminded that we live in a world of flux so that today it is almost trite to say that we are exposed to constant change and that the rate of change in today's society is unprecedented. All of us have heard such thought expressed in a vast variety of media on numerous occasions. Examples are legion to document this notion that change is everywhere, that it is inevitable, that it is occurring at a tremendous rate. We know that skills become obsolete almost overnight, we know that what we hold as fact today may well be fallacy tomorrow. Whitehead said, "Knowledge does not keep any better than fish." And in education we have said to ourselves that it is our responsibility to teach people in such a way that they will be prepared to live in and adapt to a changing world. But it would appear on the surface at least that not very many educational programs are planned to develop this skill or attitude of flexibility. In an editorial in *The News Letter,* Edgar Dale writes, "To develop the flexible man we must favor those learning experiences which have high transfer value to varied life situations. We must learn how to teach skills, attitudes and concepts so that they may not only meet current needs, but have generalization value as well."

A very simple illustration of this principle might be shown in the field of Graphic Arts. Consider two different laboratories. In the one a boy is learning how to operate a modern offset press; in the other,

a student is printing stone lithographs. The first is typical of mid 20th century printing; the second is an example of a very primitive and outmoded means of printing (though it is still common in the fine arts). At first glance we are tempted to say that a boy on the offset press is in a much better educational program than the one printing from a stone. A closer look might reveal that the controls on the offset press have various numbers and settings and that the directions for making these adjustments are either stamped on the press or have been supplied by the instructor. "Before starting press move lever A to position 3 as shown in diagram" — and "if copy is to dark shift lever C to medium position" etc. A boy learning to operate such a press is *not being educated; he is being trained.* If a new model of the press comes out next year, or if a press from a different manufacturer is purchased the boy must be retrained to operate the new press. The student doing stone lithography, on the other hand, comes face to face with some very basic facts and principles. He can hardly avoid it. One could defend the claim that there is more transfer to varied life situations in the stone printing than in the offset press operation. Please don't interpret this as meaning we should throw all the offset presses out of industrial arts—though perhaps we shouldn't be quite so hasty in discarding the old stones either—but it does mean that we must re-examine our teaching to ascertain that we are teaching the application of broad principles rather than the narrow mechanistic operation of machines. This is the difference between a narrow limited training and *education for flexibility.*

SKILL OF BEING CREATIVE

This word creativity is another joy word in educational jargon. There has been much fuzzy thinking and frothy writing about the creative child, the creative environment, creative teaching *ad infinitum.* But when all the froth is blown away the fact remains that the *complete* individual—the truly educated man—must know how to be inventive. He must know how to innovate. He must see new possibilities for applying old principles. He will be faced with new problems and the old answers will no longer be appropriate. He must develop his powers of imagination.

Creativity does not necessarily mean a discovery of the unknown. For an individual it may be a personal rediscovery of what is already known by someone else. The results so far as development of the individual are the same in either case.

The implications for teaching are obvious. Situations must be provided which foster the development of this quality we call creativity. This means that we must make an agonizing reappraisal of much of our teaching methods and content. Simply building things from predigested, tried and true project books hardly fosters creativity. Rote memorization becomes highly questionable.

The liberally educated person of tomorrow must know himself and be able to understand others. He can receive foundation for these goals in the industrial arts laboratory. Here junior high school students share with others the findings recently made in industrial arts activities.

Photo by NEA—Carl Purcell

Creativity as a skill probably cannot be taught. John Ciardi wrote in the *Saturday Review* "The truly creative whether in art or science or philosophy is always and precisely that which cannot be taught. And yet thought it seems paradoxical, creativity cannot spring from the untaught. Creativity is the imaginatively gifted recombination of old elements into new. And so it may seem there is no real paradox. The elements of an invention or a creation can be taught; but the creativity must be self discovered and self disciplined."

If we cannot teach creativity, at least we can provide an environment in which it can be developed by individuals. Such an environment will provide many opportunities for exploring, for experimenting, and for making decisions. Such an environment doesn't just happen — it must be planned.

THE SKILL OF MAKING WISE CHOICES

Having this skill or not having it is the difference between drifting through life or charting a course and living a purposeful life. Life is really a continuous series of decisions to be made. Some decisions seem relatively small and insignificant and others are vitally important: "To read a book or watch a TV program"—"which book"—or "which program." "What to cook for supper," "which tie to wear today."

Or again, "What do I want to do after graduation from high school?" "What do I plan to accomplish in the next five years?" "What *are* the *really* important issues to which I should devote my main energy?"

All of these and many more call for responses, and the ability to make the wise choice or what Edgar Dale calls the "discriminating response" is a skill which must be learned and developed.

The inertia of tradition tends to help us make many of these decisions but it also helps to put us and keep us in a hopeless rut. The question should not be "How have we done this in the past?"—nor should it be "What is the newest, most modern way" but rather what is the best, the most appropriate choice. The matter of when it is best to conform and when it is wisest to break with tradition is a choice to be made.

Just as one cannot teach the skills of being flexible or creative, he cannot teach a person how to make discriminating and wise choices. But like a good coach he can advise and encourage, help to analyze decisions that have been made and the discerning teachers can provide many opportunities for the student to make choices.

SKILL OF KNOWING ONE'S SELF

"To thine own self be true" is sound advice—but it is also a rare achievement among men. We generally do not have the gift "to see ourselves as others see us." Rather we see ourselves in a mirror of self-deception. One of the skills most sorely needed by an individual if he is to live a happy, well-adjusted and useful life is the skill of being completely honest with himself and of seeing himself as he really is.

This inability or reluctance to see ourselves as we really are exists in two directions. Not always do we deceive ourselves by assuming a superiority which does not exist. Many people fall far short of realizing their potential because they underestimate their abilities and capacities.

Certainly one of the functions of education must be to help people realize honestly what they can do well and what they can't do; what they are; and what they are not; when they have succeeded and when they have failed. In short, in order to be a mature member of society, a person must learn to know himself. This capacity, or skill as I have termed it, is sometimes referred to as self fulfillment or self realization. Whatever it is called, its importance is self evident and its attainment must be the concern of those who would be worthy of the title *teacher.*

THE SKILL OF UNDERSTANDING OTHERS

This word *understand* implies a great deal more than its users frequently intend. In addition to comprehension, understanding implies a tolerant, sympathetic, and indulgent attitude.

In the skill I spoke of previously—that of getting to know one's self—the idea was presented that it is very difficult for people to see themselves as others see them. It might be added that complete attainment of this ability is impossible. But there is a compensation here if we try to see others as they see themselves. What causes them to think and act as they do; what are their fears and anxieties, their needs and desires. This is what is meant by understanding others. And of course in this sense the group of people we call others includes our friends, family, colleagues, pupils, other races, other religions—in fact, everyone else.

To understand means to comprehend and to have a sympathetic attitude—but it does not mean to condone. The implication for education in the need for understanding others is to eliminate decisions and action based on bias, prejudice, hatred and ignorance. It is of course to be hoped that an understanding of others would enable mankind eventually to substitute love for hate, tolerance for bigotry, and peace for war.

Even if this utopian ideal is not realized (as it probably won't be for sometime to come) and men continue to disagree with other men on many issues (as they probably always will) the need for developing the skill of understanding is still valid. Mature people who disagree must learn to separate the issue in question from the personality of the opponent. The Biblical precept which admonishes one to love his enemy does not say that he must agree with his enemy's viewpoint. It also does not relieve him of developing the skill of understanding others. Educated people must develop this skill!

LEARNING TO LEARN

This final skill is so simple and yet so profund that its real significance is easily missed. The skill of learning how to learn might be expressed in another way. It is the development of an insatiable curiosity and the means of satisfying that curiosity. Children are naturally curious What makes it go? Why is it black? How does a bird fly? Where do babies come from? Rather than capitalizing on this native curiosity, formal education too often quenches it, so that by the time a child is in junior high school, he knows better than to ask "too many foolish questions." And after a while he even stops being curious. It seems evident that the role of education is to keep this curiosity alive—to develop it further, and to provide the child with the ability to find the answers himself.

The assumption of course is that to live the full life we have referred to, one must be equipped to keep on learning from the cradle to the grave. It is further assumed that the bulk of important learning goes on after one has finished his formal education. Even while in school it is probable that the most significant education is self education.

This skill of learning how to learn implies that the desire or motivation and the ability or knowhow must all be self contained. Disciplined habits of reading, thinking and working must be developed by the individual. He must become self winding.

The role of the teacher is to provide the student with opportunities for having self-educative experiences and also to serve as a model. These six skills do not exclude the importance of such subject matter as history, verbal skills, mathematics and science. In fact they are not content fields *per se.* They have to do more with methods of teaching than with content. But one who has not mastered them cannot be an educated person in the fullest sense. A good program of general education will provide for the development of these skills. And that is the kind of education I am talking about when I say industrial arts is a part of general education. And even though the phraseology may be a bit tired as I conceded at the outset—the concept is still quite fresh.

But how does this relate specifically to our topic of the day? What should industrial arts programs of the future look like?

The implications for industrial arts in the development of the six skills I have briefly outlined exist in all levels—from kindergarten to post high school education. However, in the present discussion I shall limit the consideration to the senior high school—grades 10, 11 and 12. It is at this level, I believe, that the greatest confusion exists as to the nature and purpose of good industrial arts programs. It is at this level where some see a conflict between vocational and non-vocational education; between vocational-technical education and industrial arts education. Such conflict need not—and indeed should not exist — if we keep clearly in mind the purposes of each type of education.

In the senior high school of tomorrow there should be, as I see it, an industrial arts program which has three major phases or emphases. These are not mutually exclusive and there may be a certain amount of overlapping but all three phases should exist for three categories of high school students.

PRE-PROFESSIONAL

The first of these phases might be called pre-professional. This is intended to be for students who have decided rather definitely that they are going on to colleges to prepare for such professions as architecture, engineering, dentistry, medicine, physics and the like. For such pupils there should be well organized courses in industrial arts subjects designed to support and strengthen the regular college preparatory curriculum. Though there is no reason why such courses should not represent most industrial arts areas, I believe the most

Field trips to modern industries bring real-life experiences to students. These high school students touring a large steel plant can add to their verbal knowledge the feel, smell, and other in-plant experiences needed for full development in this area of technology.

Photo by George Campbell

needed and most popular would be courses in electronics and in drafting or engineering graphics as it is now called. Such courses should be full unit, sequential courses meeting one period daily five times a week, just as courses in foreign languages or mathematics. Oh, I know that some administrators will say that such a program is impossible because the college preparatory curriculum is already overcrowded with too many academic subjects. Such an excuse is simply not factual in light of the number of forward looking new educational programs which are already offering the kind of courses I have just described. However, it might be well to emphasize at this point that the need for real quality, well planned and organized course content, and superior teaching is imperative if these programs of industrial arts are to succeed. (Parenthetically I should add that these same considerations are equally important for all industrial arts programs—and indeed for all education.)

PRE-TECHNICAL

The second *phase* of industrial arts for the senior high school I have termed pre-technical. There is possible overlapping between this and the pre-professional phase I have outlined but there are also some distinct differences. The breadth of courses available in this phase might well be greater than the pre-professional phase. Courses here would be designed to accommodate pupils who have definite interest

in technical areas but who are still undecided about their future education, or college career, or their vocational choice. Such pupils are frequently found in the "General Curriculum" in our high schools. The exploratory function of the junior high school should be extended for such pupils, though certainly the courses in industrial arts should be intensified in scope and depth over the junior high program.

INDIVIDUALIZED PROGRAM

The third phase of industrial arts for the senior high school of tomorrow is one that probably needs a new name. The name if one could be found or coined, should embody the idea that it is a general education (non-vocational) elective; that it is closely allied to (and hopefully integrated with) other disciplines in school—particularly art and science; that there is not pre-determined content but that each pupil has the privilege of planning his own program. As I envision it, such a program should be designed with flexibility sufficient to accommodate pupils of various grades and ability levels and students with widely varying interests.

What I am advocating here is not just a face-lifting of the old general shop concept—though a well equipped general shop-laboratory combination—or a series of them—will be needed for this program.

Whereas one boy or girl might become involved in a highly technical problem in electronics or rocketry, another may choose to develop the degree of craftsmanship necessary to do fine silversmithing. The program should be broad enough in concept and extensive enough in facilities to allow for individual study, and group projects; research and experimentation, and skilled craftsmanship; the solution of technical problems, and the creation of beautiful objects; an enlarged understanding of scientific concepts and a heightened appreciation of things aesthetic.

The possibilities of such a program of industrial arts is limited only by the imagination of the teacher. This would truly be industrial arts for general education. Such a program would surely help considerably to develop in each pupil the

Skills of:
1. Flexibility
2. Creativity
3. Making wise choices
4. Learning to know one's self
5. Understanding others
6. And the skill of *learning*

Preface

Education: A Practical Matter

Over the past several years educators have come to realize that the American education system, often criticized for being too pactical, has not been practical enough.

It took an alarming dropout rate and a narrowing market for unskilled labor to convince the skeptics, but now remedial action is rapidly being taken.

The Occupational Information Conference sponsored this week by the Ventura County Vocational Resources Committee provides an insight into the sort of adjustments that are being made and the reasons why they have been deemed necessary.

As one industrialist pointed out at the conference, the unemployment rate among American youths is now higher than it was during the depression — yet more than 4 million jobs are unfilled because qualified persons are not available.

Unless the educational system makes the appropriate adjustments, the situation will get worse.

Unskilled labor is generally the first to be eliminated by machines; more sophisticated automation adds to the problem by displacing skilled workers who find themselves in need of retraining.

These facts are now indisputable and accepted by educators and most of the general public. As a result, vocational education has become fully respectable.

Economic necessity has a way of eliminating stigma, and it is no longer a social handicap if a student pursues a vocational course rather than a straight academic course.

High schools and junior colleges are tailoring special curricula for the vocational student, recognizing that the standard woodshop or auto mechanics class of a decade ago is no longer sufficient.

And retraining is being emphasized in the night schools and special courses sponsored by public agencies outside the regular educational system.

The ultimate lesson is that education must be an open-end affair. Four years in high school or college no longer add up to a diploma that forever after entitles a man to call himself well qualified.

Whether he be a physician or a machinist, the chances are a student will some day need retraining or schooling in new techniques.

The necessary answer to the "leisure time" problem of the future 30-hour week may prove to be schooling.

Whether the philosophers like it or not, the American society is a practical one, and demands a practical educational system. This does not mean an end to the arts, for a practical education can produce an Eric Hoffer as well as a Bertrand Russell.

The answer to many of our urban, economic and racial problems will depend on whether the Eric Hoffers of the future can earn a living. We can be thankful that our educational system is adapting itself to meet the challenge.

ABOUT THE SPONSOR

Many have asked the question, "Just what kind of an organization is this sponsoring group, 'The Vocational Resources Committee'?" A concise explanation of its function and its membership composition follows:

Who belongs? Over 125 persons representing industry, business, service occupations such as hospitals and restaurants, as well as agri-service personnel and representatives from county, city, state and federal governments are members of the Vocational Resources Committee. Perhaps that state agency that is most actively involved is the California Department of Employment.

What is the purpose of this organization?

.... To assist individual schools in establishing advisory committees for business, industrial, agricultural, and homemaking education.

.... To assist school administrators, supervisors, curriculum directors, and teachers develop occupationally centered courses of study.

.... To assist counselors in occupationally counseling high school, junior college, and adult students to the world of work.

.... To organize panel discussion groups, to provide students and parents with knowledge concerning entry training requirements for all occupations.

.... To help relate to educators, students, and parents up-to-the-minute information concerning job opportunities not only in Ventura County, but in all of California.

.... To assist school administrators in the placement of vocationally trained students into permanent jobs at the time of their graduation from high school.

.... To provide technical assistance for individual teachers who wish to relate programs of instruction and/or courses of study to the needs of industry, business, agriculture, and service occupations.

Who coordinates the activities of the Vocational Resources Committee?

There are elected officers and committee chairmen who meet once a month for lunch to discuss problems concerning Ventura County Vocational Education matter affecting youth and adults.

The committee's work schedule is coordinated by its permanent secretary, Charles Brady, Ventura County Schools.

Group II	Conf. Room 2 Resource Person: Mack Stoker Discussion Leader: Harriet Woolley Recorder: John Van Zant, Vocational Education Consultant Ventura County Schools
Group III	Conf. Room 3 Resource Person: Anne Lewis Discussion Leader: Harold Johnson Technical Support Facilities, Pt. Mugu Recorder: John Stead
Group IV	Conf. Room 4 Resource Person: Dr. Al Powell Discussion Leader: Madeline Miedema Recorder: Lois Shaffer

Comments

No one denies that our youngsters need an education before they can function in this society which we helped create.

We appreciate the cogent view of many who hold that general education is the best approach in preparing youngsters for this task. Similarly, we appreciate the view of many others who present a strong case for vocational education as a method of preparation.

A remarkable point is that these views are not mutually exclusive.

The political, economic and social factors and words which have deluged us would convince anyone that there is merit in both viewpoints. The problem, if any, is one of recognizing the need for and respect of mutuality of interest, priority and coordinated effort.

The papers which follow represent the oral proceedings which took place during the occupational conference.

Much remains to be done, which will be done, in the field of vocational education, especially the identification of specific jobs and related characteristics of the local labor market.

The ideas expressed in the conference are those of the speakers. The errors, if any, in recording those ideas are ours and we apologize in advance.

We wish to acknowledge Francis Bawden, Chairman, who first suggested this conference and Mrs. Lois Shaffer, Co-chairman, whose efforts contributed substantially to the overall success of the program. We also acknowledge the fine clerical work performed by Mrs. Audrey Tracy, secretary to the County Coordinator of Vocational Education, and we express appreciation to the workshop discussion leaders and recorders for their able assistance.

OPENING REMARKS

OPENING REMARKS—Industry, the schools system and the state employment agency will be represented by these men who will welcome Ventura County school counselors to an occupational information conference, Oct. 11, at the Oxnard Community Center. They are, from the left, Francis Bawden, manager of the Ventura office of the California Department of Employment, Charles Brady, coordinator of Vocational Education for Ventura County schools and Marvin Berson, president of Sawyer College Schools of Business and president of the Ventura County Vocational Resources Committee, sponsors of the daylong conference.

The Occupational Information Conference was opened by Francis Bawden, Manager of the Ventura office, California Department of Employment, who welcomed the audience and who indicated that the conference was sponsored by the Ventura County Vocational Resources Committee. The Committee is composed of business, agriculture and industry leaders of Ventura County who take an active role in providing resources whereby vocational education can be offered in the schools.

Mr. Bawden introduced Marvin Berson, President of the Ventura County Vocational Resources Committee, who briefly addressed the assembly.

Mr. Berson introduced Charles Brady, Secretary of the Vocational Resources Committee and Coordinator of Vocational Education, Ventura County Schools. Mr. Brady pointed out that the conference would not provide all the answers to questions about vocational education and employment, but the skills, knowledge, abilities and resources of each of the 125 members of the Ventura County Vocational Resources Committee were at the disposal of the school counselors and administrators. He urged school representatives to use this vast source of power and potential.

"ECONOMICS OF LABOR MARKET"

Speaker:

Odessa Dubinsky
Southern Area Labor Market Analyst

Santa Ana, California

"ECONOMICS OF LABOR MARKET"

Speaker: Odessa Dubinsky

The subject given me, "Economics of Labor Market", is of multiple complexity, for the labor market is in itself an economic fact, and the economics of the labor market amy be approached from any or all directions. An appreciation of the importance of economic philosophies on our lives may be insinuated from the very derivation of the word itself. For those of you whose "Latin is few", as indeed mine is, the noun economics (and not the adjective) comes from the Latin oeconomicus -- "of or relating to a divine dispensation".

The divinity of economics depends on one's point of view - as a verb divine means to conjecture or guess, and what else do economists do. The heavenly aspect is somewhat more suspect, but there are a lot of people who have made a religion of the subject.

A dispensation is a distribution in this case of the economic resources or wealth of a nation - there is certainly an unequal distribution of the good jobs, the high incomes, and the decent living conditions.

The history of the world has been determined by economic change; indeed economic determinism or the economic interpretation of history presents the theory that in the last analysis economic factors, including especially the level of technology attained by a particular society, and the economic relations into which men enter on the basis of that technology, exert a decisive influence on the course of political, social, and intellectual evolution.

The classical concept of the economic man as an individual behaving rationally, regularly, and predictably in his economic activities ascribes to him motives that are egoistic, acquisitive, and short-term in outlook.

There are many in our country to whom these tenets remain gospel; who hold to the classical economics as the one and only choice. To them and to you, I refer to that final adjectival phrase in the last statement--"short-term in outlook." This is perhaps a euphemistic phrase for short-sighted. We can no longer afford uncorrected myopia in dealing with the economics of the labor market. Economics is a social science, studying the production, distribution, and consumption of commodities, and if manpower is a commodity (despite Mr. Wirtz's abhorrence of that connotation) we who deal in some aspect of manpower had better be hip about the interactions and interrelations of people in the labor market, as well as amount of and trends in the gross national product. The latter has become the all engrossing, all ecompassing subject of the day. John Kenneth Galbraith, in his latest book, "The New Industrial State", quips that St. Peter is assumed to ask applicants only what

they have done to increase the G. N. P., and says that we are becoming servants in thought as in action to the machines we have created to serve us.

The demand for and supply of labor together comprise the labor market, and all our efforts should be directed toward the best production of skillful manpower and its most effective utilization. The revolution of technology which has come to fruition in recent years in this county especially, requires a commitment of resources to education and vocational training on a massive scale. Every individual must be given the opportunity for education to the limit of his ability. A special effort must be made to remove the artificial barriers blocking the development of Negroes and other victims of poverty and discrimination, and to compensate for the damage already done to them.

Buckminster Fuller speaks of the ultimate revolution that is now crossing the threshold of human consciousness and moving to ultimate popular support; this is the revolution that will not only result in the successful sustaining of human life but will also permit man henceforth to participate consciously in his prosperous continuance on earth. It will eliminate the now untenable assumption that survival can be justified by elimination--on the battlefield or at the slums' lower-velocity rot-rate--of the "unsupportable excess" of human population. Mr. Fuller believes the world's prime, vital problem is how to triple swiftly, safely, and satisfyingly the overall performance realizations per pound, kilowatt, and man-hour, of the world's comprehensive resources. This will render those resources, which can now support only 44% of the world's humanity, capable of supporting 100% of the population at higher standards of living than any human minority or individual has every known or dreamed of.

Performance upgrading, capability, determination, and realization, and complete and full utilization of manpower along with the world's other resources will be essential to the attainment of this goal.

The nation has already taken important steps along the road to greather educational opportunity with the passage of the Vocational Education Act and the Elementary and Secondary Education acts. But all the bills passed by all the congresses that ever were or will be will not suffice if action, intelligent action is not taken.

Cynthia Parsons, education editor of the Christian Science Monitor, was writing as recently as last June that "schooling for skills is in trouble." She said "thousands of youngsters have been misdirected into purely academic programs when at least half of them should have been guided into direct preparation for employment. In a recent survey conducted in the east, 70% of all parents and pupils asked that vocational education be given at the high school

level or before. But 90% of the youngsters in high school were being pushed towards college, and only 1 out of 6 of those who graduated from high school actually entered a college.

But Miss Parsons went on to say that while much remains to be done, more and more school officials and systems have been responding to the need to do it, and that by and large, vocational educators are working together in a new climate of interest to bring schooling for skills into the 20th century.

The important point therefore seems to be what skills? ? and how can the information about the needed skills be dispersed to the educators, the counselors, the planners for education and training needs? For much more information is required to provide a smoother transition from classroom to job.

John K. Folger and Charles B. Nam, writing on "Trends in Education in Relation to the Occupational Structure", comment that most persons who enter the labor force are prepared to occupy only jobs that are suitable for the amount of education they have received, and that there is, of course, a direct association between level or scope of education and occupation. If, therefore, training or education has been inadequate or faulty, young workers will be unable to find satisfactory or satisfying jobs.

To realize the full potential of the nation's workers, to satisfy personal needs for income and self-respect, to meet the enormous public needs that accumulate over the years, to meet the demands for a productive and effective labor force; training, education, counseling, and area rehabilitation programs must have and use a continuous running account of impending and already experienced technological changes, and reasonably accurate forecasts of the impact of such changes on jobs, skills, the location of industry, training needs, etc.

To use the subject word in its other sense, it is hardly economical to permit the suffering and waste involved in training people for jobs which may be eliminated by machines before the training is completed or soon after or for which demand is minimal, or for which the job specifications have changed completely. For example; from 1956 to 1962, white collar occupations, jobs in the service industries, and unskilled work generally held to long term trends established after World War II. In the last five years, however, sustained economic expansion has produced definite variations and shifts in these groups. The number and proportion of professional workers have grown at a steady pace; blue-collar workers have been most vulnerable to down-swings, and while increasing in number, have lost considerable ground in their share of the total. Service jobs have increased sharply, both in volume and proportionately. Whereas, blue-collar workers represented the largest percentage of all jobs in 1946, now white-collar workers have taken over the top spot, and indeed comprise 45% of

the total. The best the factory workers ever did was 41% in 1946.

Changes in industry employment size and growth result from the combination of three factors: (1) final demand; (2) employment--output relationships, or unit labor requirements; and (3) inter-industry relationships. Jobs, therefore, are an intrinsic extrusion of those economic factors primary to the overall prosperity and well-being of an area, state, or country. Knowledge and understanding of industry trends, what foments changes, and what is to be expected in the future are all essential to the leading or directing of the pre-labor force participant into those occupational fields of most advantage, satisfaction, and potential.

It is surely not enough to know or discuss just the right college; it is essential that the youth counselor be familiar with and knowledgeable about the economics of his community, his state, and his country. He should know and be able to relate information concerning the industrial and occupational structures of the labor market; to recognize the capabilities and capacities of the counselee in the work-world; to help the youngster to find his place in the job market. Perhaps time spent thusly would be better spent than in recording grades, setting up schedules, or even on disciplinary problems. Perhaps there are other employees who could be used to advantage in these tasks, while the trained counselor helps youngsters prepare themselves for that real and earnest life that almost always includes working for a living.

I strongly suspect that this was not the tack you expected this discussion to take. Usually, I talk about industry and occupational trends; but we are in a state of revolution in this nation, and I have in this small way rebelled against the accepted pattern. If you have questions to ask about occupational and industrial trends, I'll be available during this afternoon's workshop. Manpower and employment problems are of high significance and import in these days of fast labor force growth, when a high rate of unemployment coexists with persistent shortages of certain types of workers. The level of technology attained by this nation has brought its own paradox; it is a national phenomenon and poses an equal threat to the Mississippi cotton picker and the Illinois steel worker; it brings the advantage of growing employment potential in areas of activity almost unknown short years ago.

Young workers will provide almost half the additional labor supply in the present decade; the amount and quality of their education and training will be important to them and the nation. Proper counseling can guide young people into preparing for those occupations for which they have aptitude and in which they can reasonably expect to obtain employment.

And there's no capsule education available to train the counselor; no Reader's Digest of palliatives nor ten easy lessons in economics or in labor market analysis available. The answers I might give today could be obsolete tomorrow and you might find them a placebo instead of a specific. The point I hope

I have made is that you are dealing with our most valuable economic resource - the worker of tomorrow. All education is truly vocational education. It is our business to work together in this new climate of interest and understanding to help the coming work force enter the world of work with marketable skills, with appreciation for the labor market, and with a good opinion of themselves.

"HOW EDUCATION AND THE STATE EMPLOYMENT SERVICE WORK TOGETHER"

"HOW EDUCATION AND THE STATE EMPLOYMENT SERVICE WORK TOGETHER"

Speaker: Mack Stoker

Ladies and gentlemen, I feel a little foolish coming to Ventura County and talking about cooperation, because some of the finest cooperation in the state has been going on here in Ventura County. You are doing a beautiful job. I am supposed to talk about the cooperation between the State Employment Service and the educational institutions that carry out the programs that the Vocational Resources Committee identifies.

Through the years, we have reached the point where we indulge in a lot of mutual trust. The mutuality of interest of education and employment is so close that we could not do anything other than work together, because we are all working at one point or another toward similar goals. We have to cross each other's paths and once in awhile we cross each other up, but this happens very seldom.

It took a while for us to recognize ways in which we could support each other. At one time there were some employment people who swore the schools were doing a lousy job turning out people who couldn't be placed on the job after training, and a few school people said, and I quote, "The Department of Unemployment is more interested in paying dividends than they are in placing our graduates."

But through the years we have come to help each other in the placement problem. When the Department of Employment pushed into testing, particularly as related to the selection for apprentices, there were quite a few school people who felt that their realm of counseling was being violated. But time wore on and fears wore down and we found new ways in which we could help each other.

In the past employment placement officers have worked with the schools and in a good many schools; high schools and junior colleges, a full time or part time Department of Employment employee was actually present on the campus, working with the school people and placing students, graduates and dropouts into job opportunities.

Then as employment extended its capability in identifying occupational trends and development, the schools found that an analysis of the results of school training programs was necessary in developing vocational curricula. As she worked into this analytical job, Odessa Dubinsky became known among educators almost as well as she was and is in employment.

Now, I suppose, no school in Ventura County certainly, and not in California, would think of starting a new program until they had conferred with the

Department of Employment to see what jobs are open, what the trend is, and so on.

Then the next big shock to our getting along with each other came about when MDTA came along. As you know, in MDTA the Department of Employment identifies the need, writes a prescription in a way, assures the school that trainees will be available and the school prepares a training program to do the training.

The idea that the Department of Employment would select trainees and send them over to our schools was positively revolting. Nobody sends students into our courses unless we select them, and we fought that battle up and down the State. Some of these battles were not a total loss. I can think of one that took ten days, involved two of my bosses, two legislators and I don't know how many telephone conversations, meetings, interviews, and finally was resolved.

There has never been any difficulty working between the regional office and the area office of employment. In employment there is a state office and area offices. There are two areas in Southern California. The one for this area is headquartered in Santa Ana. The other is in Los Angeles. In our office for vocational education we cover eight southern counties.

In all the time we were having our Donnybrooks there was never any problem in getting together with the area office. This was easy, but what took a little doing once in awhile was to sell our respective co-workers in the local districts on the solution. This took quite a bit of time and again it was pretty much an educational process. The local people finally realized that they had to work together. They are interested in the same thing and in a good many cases the employment people leaned over backward to placate the fears of the school people who did not want them to select trainees and refer them. Cooperative approaches were set up and in a few cases I think the trainees were sent out to the school to take a look at the facility to be sure that was what they wanted to be a part of, and the school people felt under these circumstances that they did interview these trainees and so they did accept them.

Now I know of no case in recent years where we have had any difficulty in this area or field. Let us now talk about how we work together. We do it in several ways and on so many levels that we have to over-simplify in order to make a short speech about it.

Starting at the local level, the local school and the local employment office, we will talk about MDTA first since it is more complicated and more involved but it illustrates more intensively what may happen.

The Department of Employment local office identifies a need. Maybe some industry tells them about it. Maybe they run a check and do a job survey

and decide twenty electronic assemblers should be trained. Interview enough people, watch the people at work, find out what they need to do and then write out this prescription which calls for twenty workers who can do this job upon graduation. We estimate a time that it might take to do it. The form (MT1) goes through channels of course; always to the area employment office where it is reviewed and approved. It then goes to the Sacramento office where it is reviewed and approved. Then it goes across the street through one of my several bosses where it is reviewed and approved. The form then comes back to the regional educational office and the regional office assigns it to some school to do the work. They might call John Stead, Coordinator of Vocational Education, Ventura Unified School District and ask him if he can train these twenty people. The program will take about so long and we ask him to make a budget to see how much it will cost. In a way that may seem a little silly because that piece of paper went all the way to Sacramento and back, which took about three weeks, and maybe the school is just across town somewhere. This is the way it has to work apparently.

The school makes out a training plan, writes a budget and sends it back to us and it then goes back through channels to Sacramento and is approved along the way. There is an approval team composed of Department of Labor and Department of Health, Education and Welfare people who must approve the project and then it is ready to start.

Employment identifies the need, determines the competency level needed, the school writes the training plan and then we are in business. Of course the school makes reports because their work has to be checked for the training and also for payment of training allowance to the trainees. The school has to report frequently on how many people they have, if any have dropped out, and so forth, so that the Department of Employment manages to get the allowance to each trainee regularly though I still don't see how they do it. It seems impossible.

At the regional area level, and the county is always a confusing element here, except Ventura County, sometimes the county school office is in on the original. A good number of the projects here originated in the county working with the Department of Employment. They then come back through channels. Sometimes the county schools office works directly with the area office and sometimes they work directly with our regional office in education.

They get in on the program on two levels. The regional office where Ed Roberts the assistant regional supervisor of Industrial Education, and I work in Los Angeles, works with the local employment offices, also with the area offices and most of our operations there are on committees. There is a committee for everything and usually these coming programs are discussed in committee before they get to official action. This committee might be one formed by our office or it might be set up by the local employment office or by the area

employment office. The committee meets informally on the call of the chairman. The programs are discussed there.

At the state level, again we cooperate with employment in a number of ways. We work together at the state level in major training needs, changes in industry that look as if they may affect everybody in the state, semi-political problems, not usually partisan politics but manuevering politics. We have two or three committees to handle these. In recent years I don't know of any serious disagreement that has come out of these committees. There have been some minor disagreements, yes, mostly a matter of operations or tactics rather than long term or policy, but when a decision is made it is passed on through channels.

Nearly always, strange enough, the memo the employment people get says about the same thing as the memo which we get and in this way we avoid confusion. In fact, it is about to get to the point now where it is not much fun in this business anymore because we don't have any good fights. It gets kind of dull if all you do is get a memo and read it and initial it and the work is completed on that job for the day.

Getting back to the selection of trainees just briefly, this is one of the places where we had trouble earlier. This was because the school people and the employment people did not work together closely enough. For example; suppose we have a training job to do and employment people are able to recruit high school graduates. This would be a different training job than if employment could not recruit high school graduates. Obviously if a youngster or an adult is going to have to learn a little arithmetic or science or whatever and he doesn't know the basics of it, the training job will be longer than otherwise. That is why employment people and the school people get together and talk. It is essential that each party understands the problem and what we are going to have to do with it.

We had one or two cases in which some of our boys would call up about a program and indicate they could not handle the program. The reason was they expected all students to be high school graduates and they actually got only three graduates in the entire class. What was the story? Well, there were just no high school graduates who could be recruited for that job. Here, again, maybe we slipped in our communications system just a bit but it took a few cases like this to work out patterns of successful operating procedures.

Once the trainees are selected now I guess the operation is almost faultless. I don't hear any complaints regarding this matter.

The other place in which we had to beef up our operations a little was in training to a designated job competency. How do you spell this out. How specific can you get. More and more those job description are more and more definitive and soon it became possible from the job description for the

instructor to know what he had to do. Sometimes the instructor visited two or three plants and saw the people at work. He then knew what had to be done. All he had to do was train to that job competency, refer the trained people back to the Department of Employment and they were placed. Placement has been good in most cases.

As school people, one of the knotty points we are concerned with is with evaluations and follow-up. Anything that you can do and work out here in Ventura County to improve your follow up of students, the graduates, and see what they are doing, how well they are getting along, would be appreciated. Feed that back into the training program and it will be helpful. This is one of the places, I believe, where we need more time and money spent than we have been doing. We would certainly like to know of any development here in that direction and as I said in the beginning, if anybody gets a good answer, it probably will come from Ventura County. Let us just leave it at that until the workshop this afternoon.

"EMERGING AND DECLINING OCCUPATIONS"

Speaker: Anne Lewis

I can't tell you how delighted I am to have the opportunity to talk to counselors. First of all, I rarely have the opportunity to talk to any group of people so this is kind of a new and novel experience for me. Secondly, in our little isolated way we are concerned entirely with employers and in new jobs and old jobs and so on, and almost never have the opportunity to talk with people who are instrumental in getting younger people into these jobs. For me this is grand. I have been looking forward to it.

I have expanded the topic somewhat by request. Initially I was going to talk about new jobs coming in and old jobs declining in the economy, but it has occurred to several of us that high school counselors are faced with a unique and difficult problem in this youngster who is not going on to college. I was thinking to myself that if I were a counselor with the pressures that counselors have, and I have a couple of good friends who are counselors so I am aware of the administrative pressures, there is always somebody waiting, you're late, and there are all the interruptions, I would know that 9 out of 10 youngsters are being prepared for college and I would know that 1 out of 6 would go. So what am I going to do about it? This is the problem.

You see I am wondering how it would feel to be one of the people who has to struggle with these problems. I would think that there would be a lot of kids in my office that I really didn't know what to tell them. As Odessa pointed out, it is a placebo. You say something and hope that maybe they will go in the right direction and hope for the best. This is hard on everybody. It occurred to me, too, if not in your office, certainly nearby there may be a kind of Aladdin's lamp to solve just this problem that we are talking about. The genie really comes out of the bottle, and this is what I want to talk to you about. It is called the Dictionary of Occupational Titles. You're familiar with this, I know, but I doubt very much if you have ever had occasion to really use it. If you have ever gotten so far as to have read the instructions, you may have given up. They are deadly. There are instructions as to how to use it. But Volume II of the DOT was designed especially for counselors. This is not generally known. I am so enthused about this volume and what you can do with it in five seconds flat that this is what I have decided to talk about. We felt that you might find this interesting. The short cuts used in Volume II that will help you with this youngster who you are trying to help.

Let me tell you then that the Department of Labor, for some background, is charged by Congress with keeping the country completely up-to-date on what is happening with the economy. As the kids say, "What's happening." It is

part of our job to keep the country posted and one of the ways we do this is to study industries in the United States. There are eight field centers. Headquarters is in Washington and field stations are around and about in the United States and there are from 10 to 15 job analysts in each one. Washington has simply parceled out the industries. There are about 250 of them. In the Los Angeles office we have 65 industries and it is our job to know what is going on in these industries all the time, from top to bottom.

We get our information by going to these industries and by studying the job and talking with the workers, but going to two or three companies in the same industry so that we are sure our information is accurate. Then we write about it. In your packet which has a wonderful collection of material, you will find what we call a complete job description which I thought would interest you because it's about a Maitre 'D. I just went through our files to see what might be of interest to you. Rather than ask you to plow through a machinist job description or something like that I picked a job that everybody knows. The Maitre 'D at the plush hotel. This information consists of a complete job description for him.

You will see that it goes on for several pages. All of it is occupational information and all of it goes to Washington and from this the material that is in the Dictionary of Occupational Titles is extracted. This is how they do it. Just look at the first page. Just glance at it. It is long, 250 to 300 words or so. In the dictionary it is much shorter.

You will also note that some of the other pages are not reflected in the dictionary definition. The other pages turn up in Volume II which is what I want to talk to you about.

For all of the thousands and thousands of jobs in the DOT, there are at least two sets of job information like this. For example; there will be two Maitre 'D's. One from Los Angeles and one from another part of the country and these are consolidated in Washington so that the job definition reflects the way things really are across the country. This is not anybody's effort to set standards. It is the effort to report things accurately and up-to-date. That's how each of the definitions is obtained.

Now as you go on into the back of the DOT you'll see something called physical demands and codes and all sorts of things that are involved in our ratings of jobs. This material is used in Volume II.

Let me read something from Volume II. See what you think of it. These are the worker requirements for a job cluster and it says, "An occupationally significant combination of sympathetic attitudes toward the welfare of others; capacity to absorb training and apply knowledge to the solution of diverse problems; verbal facility to relate to people of all levels; organizational ability in order to plan and direct guidance programs; tact, poise,

and general demeanor tend to inspire confidence and esteem." Those are the worker requirements that we say are essential to counseling. There is nothing here about training, nothing here about high school courses or college courses or on-the-job experience.

These are the traits we're concerned with in Volume II and this is essentially what you are concerned with. Your youngsters may not have had any experience or training. It would seem to me that you have various tests that can be administered and a counselor's own judgment is simply supported by the tests and you can get by without them. Your problem would be to identify their traits. You can tell at about the 10th grade about a child. Is he mechanically inclined or not? In which way, generally, is he going. This part isn't hard but this is a worker requirement that you are thinking about and it is not a personality trait. It is not abilities.

When you are thinking about jobs, this kind of thing becomes a worker requirement. The worker must have this ability to do the job. Volume II is loaded with dozens and dozens of worker requirements. Suppose someone comes in who has different kinds of abilities from the kind you are familiar with. Some of them are not as easy to recognize but there must be some way to evaluate them. A very good way to evaluate is found in Volume II. Volume I is also broken down by description, but in Volume II there is a coding system. . . a short cut. Every job in the DOT has six numbers or digits, three numbers, then a decimal and then three more numbers.

These last three numbers to the right of the decimal with the use of the DOT, Volume I, can give you a world of information once you have the key, and the key is in Volume II. Of these last three numbers, each stands for a point in a hierarchy of three different kinds of ability. You might think of it as being columns instead of numbers.

In the first column is a kind of ability we happen to call "Data." A more familiar phrase may be "abstract ability", the ability to handle concepts. The next number or column would be "People." There are different social skills and I equate that with social ability in the psychological sense. The third number of course we call "Things", but it is broadly equated not by any system. We did no research on this but we are talking about how to use the DOT. The third one is broadly equated with mechanical intelligence or concrete intelligence as it used to be called. These are very broad but what you're after are these three numbers.

Any number there from 0 through 7 has some meaning. The higher the number, the less the ability. In the back of the book, Volume II, you will find definitions for each of these numbers through number 9.

If you want to put your own number, just for an example, under data or the abstract the first number would be 1. This means "coordinating" and by our definition this means determining time, place and sequence of events

and determining courses of action and so on. The second number would be 0 for counselors and this is as high as we can go. We define it as "mentoring" which means professionally you give advice. The third column is 8. Nothing significant there. The third column is mechanical intelligence, mechanical ability, things that you actually handle in your job. This doesn't mean that you don't have the ability, but things you handle physically in your job.

Remember mechanical is a physical thing. You and I speak of handling this or that problem. In the DOT when you handle something it means pick it up. All you ever pick up, and this is enough, is pencil and paper, books, reports and telephones. It's what goes from what's in your hand into your head that matters. You are rated high on coordinating and high on working with people. From our point of view, a high school counselor could have one hand. He could do a beautiful job. Remember, the third column is concrete, tangible. The top level there just for information is precision working and this would be a top flight machinist. You can see he is very busy with all sorts of gauges and tools, and machines, and you'd have to go with him to find out what he does. The three columns and their definitions can be so useful. If you have access to Volume II, use it.

I would suggest that you get a 3"x5" card and write down the meanings of Volume II codes. I could read them to you but that is probably not feasible, and it is tiresome.

Let's say you wish to look up a job in Volume I DOT. Someone comes in and asks you what is a turkey inseminator. Something impossible and which you have never heard of, after all, there are 30,000 titles. Someone wants to know about a job and with your little 3"x5" card you turn to Volume I and find that you are using it as a regular dictionary. If you want a carpenter look up "C" and you will find carpenter. You read the definition, find out what it is. Now you have your 3"x5" card which tells you what kind of worker traits are involved in this job. There are the six numbers and you have the code system for the last three which is what you want to know about.

So here is someone with no mechanical ability coming to talk about a job. You can see from the way it is rated it requires real mechanical skill and you can point this out. You may not always get this from the definition but you will always get it from the rating. This is sort of instant do-it-yourself evaluation of the job and for high school counselors I should think this would be invaluable.

For counselors in the local office this would be a horrifying way to do anything but for high school where you are just trying to get the general idea, this is extremely useful. It may seem as if I am almost selling it but I feel so strongly about this that I do urge that if your schools do not

have this, then they should get it. You can get it from the Government Printing Office and I think the total cost is $9.75 for both volumes.

With the way it is arranged with the worker traits, Volume II has an entire set up by industry, also. If you want to know what's in the plastics industry, which is a new one here in Ventura County, you look and see the various job titles in the plastic industry. Frequently, just from seeing what the titles of the jobs are, you can get a very good idea of what's going on and it might be pertinent to some youngster that you have. You can make a list of titles in 20 seconds. So there you are. You don't have to call anybody. You don't have to say go here and go there. So much for the DOT.

Now in the emerging occupations the new jobs that you hear about - one of the most interesting things to me is that 99.5% of them are not new to the economy. They may be new to the industry where you see them. They may be new to the West Coast. They may be modifications of old jobs. But the skills and duties involved are not new and there is certainly nothing magic about the talents needed in today's market.

There is a difference, for example in the medical industry. In the entire medical field now there is a tremendous emphasis on computor related abilities. This is new to medicine but it has been going on in banks as everybody knows and in insurance companies and so on. The skills here in medicine are not the same as those needed in let us say a clerical job in the medical field. They are not the same as the skills needed in a bank for reasons which I'll get into later if I have time. But the actual skills such as running a teletypewriter or coding the information are exactly the same. Nothing new. There's nothing new about coding itself. It goes back in time.

So when we hear of these new jobs, we think so much of the glamour jobs, the rocket going off into space, the electronic marvels and so on. But from an occupational standpoint of what it takes to do this kind of work there is very little of what is really new.

What we have are new combinations so if any of you ever feel apprehensive about this brand new whatever it is that is coming on the market, or a new kind of a job, I think you can find what you are looking for in a counseling problem if you remember the elements of this job, whatever they are, are probably not new. The overall picture itself, may be, but not the job. As pointed out, the profile, if you think of all 30,000 jobs as being on a scale, there are now not so many buggy whip makers, but there are some. There are! Disneyland is one for example. So this has not died away.

As far as I know, there is no rumble seat upholsterer but I wouldn't really say this job has gone because sure enough here would come a renovated Cord or something like this. But instead of having alot of rumble seat

upholsterers now we have only one or two.

Instead of having only one or two programmers 30 to 40 years ago in electronic data processing, now we need thousands. Same job, more people. Same job, fewer people. This is generally how it goes for the entire profile, not so much the jobs but the profile. So when I speak of emerging jobs I don't mean brand new that have just been crystalized out of some powder somewhere. These are jobs that are on the increase in the economy and there are quite a few of them.

An example is the electronic data processing field which is not unfamiliar to a lot of people I know. I am speaking only of high school graduates. I have eliminated anything beyond that. We all know the cry for systems analysts and engineers is tremendous. But this is not your problem at all. The data typist people and the computor operators and the coding clerks and the tape librarians and the various data processing trainees are in considerable demand. Now these jobs require people who are good with details. Now I leave you with that problem. How can you tell whether a 17 year old is going to be good with details on the job. I don't know. But this is one of the worker requirements. Certainly the ones I know are not good with details around the house but what they would be like in a job setting is something else again.

Most employers in the medical field will train their own people and this is really important. The medical field as you know is expanding tremendously, what with Medi-Care and every one having more insurance and so on. Other companies are not so active. So you can keep your eyes and ears open about such things and keep checking with Mr. Capritto over at the Department of Employment office. The local needs for keypunch operators, should some students develop an interest in this area or not depends on where this person is going. In some areas there is quite a need for keypunch operators and not in others. Some high schools will train for it and some won't. I think really your best bet is to stay away in your thinking from specific jobs training. If the youngster has clerical ability you can help him find this out. You can tell the youngster where to go for training. This is all you can do except check curricula. If there are office courses available this youngster should enroll in these courses.

I was to touch on the service representatives. There is increasing demand for these people. This is like the telephone company. Business service representative. The utilities have them, too. Manufacturers have them. There are quite a number of them in these areas. And these require youngsters with more of a sales or promotional ability. Office manager trainees.. here again just the same thing. Picking this youngster up at about the 10th grade and checking into the possible office courses available. Sales trainees and warehousemen... believe it or not, warehousemen are coming back. Maybe you didn't realize that they had been away but they had. The entire

materials handling industry has changed enormously. It used to be that everything was loaded and unloaded by muscle. Not anymore, this is all mechanical now. But now it takes a combination stock clerk and dispatcher and they generally call this job now warehouseman. I'm giving you a very rough run down on that. They are in demand. In many of these fields, the promotional possibilities are good.

I don't want to be too specific because I think this would just obscure the things that you can really do. Also, because it may be different within six months anyway. The revolution is going so fast that it is hard to keep up with specific changes, only trends. But for a youngster who is not going on to college, promotional opportunities are excellent in many areas. The utilities are very good about this... the gas company, electric company, phone company and so on.

I would like to point out here and stress an aspect of these promotional possibilities. One thinks of everyone as becoming at least vice president, and if he is sort of lazy maybe only sales manager, or whatever. This never happens. I think it is very helpful to be realistic about this. No job is necessarily a dead end job for anyone and no job is necessarily going to lead to a promotion by itself. It is much better with your youngsters to think of them in a field where they belong and leave the rest of it up to them, once they get in. We get some pressure on us and justifiably so.

People ask what is the promotional line to general foreman, or to being superintendent of schools. This is a good example. You are not superintendent of schools and to establish my point, without being flippant, I would say well why not. Didn't you get your bachelor's in education. Don't you have a teacher's certificate. You have your counseling credential. No administrative credential? Well, you can get that. If you really want it. You see, this is what happens to everyone on a job. Either you are where you are now because that is exactly where you want to be - you don't want to be superintendent; you're not interested in promotional possibilities - or there are any number of excellent reasons for stopping right where you are or for changing fields altogether.

Your students are going to do this too. I would not be at all concerned about anybody who you organized for a job which is apparently a dead end job. If it's the right field for him, he will be all right. Don't worry about it. And if it's the wrong field it's going to be a dead end job for him. This is the way it works.

In addition to the industries I've touched on, insurance is booming. Insurance jobs now are mostly electronics data processing related. Medical health science is expanding enormously. I have spent all year until the first of

October writing a small book getting all the information, a fascinating assignment, on the application of computors in the medical health sciences. I am certainly up-to-date on what is happening there. I had a marvelous series of experiences. I went to some 40 different firms that were busy manufacturing parts and what not and all the universities and hospitals nearby. We have isolated 19 new jobs. These are really new combinations, ranging from a lab aide who requires an 8th grade education, to the much in demand junior college graduate or college graduate systems analyst. The computer has really arrived in medicine.

This business of diagnosis by computer is nonsense. I mention this in passing because it is so overrated and over-talked. The computer is a calculating machine and a giant file, and that is all it is, really. One can do marvels with the calculator if you happen to know advanced mathematics. So when you hear of a diagnosis being made by a computer what happens is that certain symptoms are given to a computer and quick as a wink it compares these symptoms against thousands and thousands of other diagnosed cases and out pops the anwers. It really does seem like magic. Your symptoms may or may not match. That is all that happens. It has nothing to do with occupational analysis or high school counseling, but it is an interesting point and I thought you might care for it.

I am running overtime and I am sorry. I am looking forward to any questions you might have.

School Counselors at Labor Talks

★ ★ ★ ★ ★ ★

Students 'Most Valuable Economic Resource'

OXNARD — Over 125 county high school counselors were told Wednesday that they "are dealing with our most valuable economic resource – the worker of tomorrow."

Odessa Dubinsky, a labor market analyst with the State Department of Employment, said that young workers will provide "almost half the additional labor supply in the decade . . . and the amount and quality of their education will be important to them and the nation."

Miss Dubinsky was one of the speakers at the day-long Occupational Information Conference sponsored by the Ventura County Vocational Resources Committee at the Community Center.

It was the first conference of its kind ever held in the county.

Miss Dubinsky said manpower and employment problems are of high significance in these days of fast labor force growth.

"A high rate of employment co-exists with an existing shortage of certain types of workers," she saidd.

"The level of technology attained by this country has brought about its own paradox" and "it is a national phenomenon that poses an equal threat to the Mississippi cotton worker and to the Illinois steelworker in his possible loss of job."

Miss Dubinsky said that "knowledge and understanding of industry trends, what foments changes and what is expected in the future are all essential to the directing of the prelabor force into those oocupational fields of most advantage satisfaction and potential."

She told the counselors that "it is our business to work together in this new climate of interest and understanding to help the coming workforce enter the world of work with marketable skills, with appreciation of the labor market and with a good opinion of themselves."

Mrs. Anne Lewis, a supervising job analyst with the Department of Employment, Los Angeles, said that 99.5 per cent of the new jobs "you hear about are not new to the economy."

"They may be new to the industry where you see them," she said, "they may be new to the West Coast but the skills and duties are not new and there is certainly nothing magic about the talents needed in today's market."

The conference also included a number of sectional meetings and workshops.

A. J. Capritto, speaking for the Vocational Resources Committee, said, "The motive for the conference was to show the school counselors in the county an authentic view of work opportunities."

He said the conference was "especially timely because the county is now shifting to a broader industrial base — we have new industries, new job requirements and there is a rebirth of interest in vocational education."

Bureau of Pupil Personnel Services

State Department of Education
Sacramento, California

"FUTURE OF VOCATIONAL GUIDANCE"

Speaker: Dr. Al Powell

To dedicated believers in a Supreme Being, nothing is more earth-shaking than publicity given to the concept that "God is dead." Such concepts rock the boat. Boat rockers by-and-large are unwelcome in stable institutions; if you don't think so, try being one.

To dedicated believers in vocational guidance nothing has been more earth shaking than the numerous articles and books that purported to write "The Epitaph for Vocational Guidance." The idea that vocational guidance might be dead has rocked the boat. The boat rockers have forced many believers to take a closer look at vocational guidance. A current national and statewide trend can be documented: Vocational guidance programs are being revitalized, the birth rate of vocational guidance programs is increasing and more attention is being paid to vocational guidance than ever before. It is only Frank Parsons that is dead.

Trends must have at least two different places in time in order to plot the direction and the speed of growth. I have chosen three points in time: (1) The status of vocational guidance in California two years ago as reported in A Study of Counselor Education in California; (2) current attempts to revitalize vocational guidance that are being tried in various places in California today; and (3) a projection to the year 2000.

By mandate of the California Legislature, the Bureau of Pupil Personnel Services was requested to "conduct a study of alternative methods of expanding programs for training vocational counselors..." Five recommendations resulted from the findings of the study:

Recommendation 1: Additional funds should be provided by the legislature to the public schools. These funds should be earmarked for the following purposes: (a) to improve the ratio of counselors and students; (b) to improve and extend physical facilities and materials for guidance and counseling; (c) to provide released time for counselors to work in the local community for the purpose of studying the labor market; (d) to provide for the assignment of a credentialled counselor in each secondary school as a full time specialist in vocational guidance; and (e) to provide counselor aides or guidance information technicians to assist the regular counselors.

Recommendation 2: The State Department of Education, specifically the Bureau of Pupil Personnel Services, should develop and conduct regional

inservice workshops for school counselors which focus upon local labor market information and career planning activities. The cooperation of the California State Department of Employment should be enlisted in these activities. Workshops might deal with such specific topics as educational planning (including a description and in-depth study of junior college and trade school offerings), entry employment (a description and in-depth study of entry jobs in a given geographical region), theory and procedures of vocational choice (study of recent research on career development theory and of the use and application of occupational information).

Recommendation 3: At the state government level, an interdepartmental committee on vocational guidance should be established. Departments such as education, employment industrial relations, rehabilitation, and social welfare employ counseling personnel who deal with vocational guidance. The need for expanded training programs would be an appropriate subject for consideration by such an interagency committee.

Recommendation 4: Local school districts should expand their vocational guidance activities, such as by: (a) increasing the time available for counselors to study the business and industrial community; (b) conducting inservice education programs to assist counselors to become better informed about the importance and the techniques of vocational guidance in the school counseling program; (c) encouraging youth opportunity center counselors and other agency counselors (social welfare, rehabilitation, etc.) to participate in the school vocational guidance program.

Recommendation 5: The colleges and universities which prepare counselors should: (a) evaluate their course offerings in the area of vocational and career planning and extend and strengthen them as needed; (b) work cooperatively with the State Department of Education on the development of programs at the bachelor's level or below to prepare counselor aides who would deal essentially with information - its collection, collation and transmission; (c) establish, if an emergency exists, a short term (6-8 weeks) full-time program for counselors of out of school youth, e.g., Job Corps counselors, followed by weekly, continuous inservice training at the completion of the basic course of study.

Many of the recommendations have already become evident in various programs throughout the state. What then are a few of the promising programs that seem to be revitalizing vocational guidance?

(1) Project Search in Stanislaus and Santa Clara counties has provided data of graduates over a period of five years. This continuous and intensive follow-up has supplied data which has pointed out and justified changes in curriculums and in counseling and guidance programs: (a) the increased use of the General Aptitude Test Battery; (b) activity

units rather than more traditional "text-book" units; (c) industry adopting a school; (d) inservice training for school counselors; (e) an improvement in the use of student records.

(2) Project VIEW in San Diego and the use of 16mm cartridge loop films in San Mateo have revolutionized the presentation and use of occupational information.

(3) Palo Alto and San Diego have utilized the games approach to career decision making.

(4) Planned programs of vocational guidance from kindergarten through 14th grade are appearing.

(5) Vocational counselors are increasingly prevalent and their role is more clearly defined.

(6) Interagency resources are cooperating in total guidance efforts which encompass whole communities - for example Project ACCENT in San Bernardino.

(7) Career Guidance Summer schools are being established. A very successful one the last summer was operated at Mt. Diablo.

(8) Considerable effort is being placed by some school districts on "Employment Readiness" - notably the Oakland Unified School District.

(9) Federal monies are being supplied through various titles to improve vocational guidance: (a) VEA and NDEA are jointly funding several projects; (b) ESEA, both Title I and Title III, is making possible innovative vocational guidance programs; (c) OEO in many projects has provided career information and retraining opportunities.

The new emphasis on vocational guidance is exciting. And now, what of the year 2000? I take my data from a report entitled Summary of the Working Papers of the Commission on the Year 2000. I shall mention only a fraction of the projections this study makes and some of the implications for vocational guidance:

(1) People will go through career cycles. The use of leisure will involve vocational education and retraining. There will be a need for accommodating the people to a career sequence. There will also be the need for education for enjoyment of the finer things of life as illustrated by good literature, artistic creations, craft work, athletics, and so forth. There will also be the need for further education in civic participation.

(2) Indecisiveness about what to educate for will increase.

(3) In the western world the typical worker will work 1, 100 hours per year. This will be a 30-hour week with 13 weeks vacation.

(4) We shall develop measures of educational status rather than school completion.

(5) The most distinctive character of our society is, and will become even more so, its education. Within fifteen years two-thirds of the metropolitan population will have attended college. The experienced professional will go back to school for advanced training every two or three years. The survival of a firm will depend upon proper exploitation of brain power. There will be increasing job mobility. Participants will be shifted from job to job and even from employer to employer with little concern for roots.

(6) People will be more intellectually committed to their jobs and will require more involvement, participation, and autonomy in their work. Jobs will become more rather than less involving. Man is a problem solving animal and the tasks of the future guarantee a full agenda of problems.

(7) By the year 2000 education of many kinds at many different levels for human beings at all stages of life and from all over the world will become the central activity of people in the United States.

(8) The very probable growth of adult education can take place within some rubric such as vocational rehabilitation, but it might be more positive if developed within (a) more vividly established patterns of alternatives between periods of productive labor and periods of education, (b) development of meaningful patterns of social and civic participation, and (c) enrichment of leisure time activity.

The future of vocational guidance seems assured. I am not sure just what form vocational guidance will take as an adult - I have dealt with enough people in enough agencies and school districts to know that by the year 2000 everyone will not have agreed as to the ideal vocational guidance program.

I feel as though I am speaking to an audience of only vocational counselors. If you call yourself a teacher, the application of what you teach to whatever the future might hold for the youngsters in your classes is in essence vocational guidance. Teaching will become even more practical and applicable. If you call yourself a counselor you do vocational counseling whether you recognize it as that or not for every educational decision and many personal decisions influence vocational decisions. If you call yourself an administrator you are participating in a vocational guidance program as long as you continue to evaluate the success of your school

in terms of the success of your product, the youngsters themselves, in either school or on the job or both. Any follow-up study will show the influence of parents on the vocational decisions youngsters make. So even as parents you are involved in vocational guidance. Those of you in placement, rehabilitation and personnel work know that you are intimately involved in vocational guidance, directly so. All of you serve as adult models and in that respect you are part of a vocational guidance program.

In view of what vocational guidance has been, is, and shall inevitably be, I have a plead: Recognize that vocational guidance is as much an attitude as a fact. I urge you all to hasten to recognize that you are all vocational counselors; it is an inevitable role that you must play. There is both a great need and current movement to improve vocational guidance practices. With this particular group it seems safe to bet that vocational guidance does have a brilliant future.

"WHAT SHOULD A COUNSELOR KNOW ABOUT INDUSTRY"

Luncheon Speaker:

Norman Nicholson
Vice President

The Talley Corporation
Newbury Park, California

"WHAT SHOULD A COUNSELOR KNOW ABOUT INDUSTRY"

Speaker: Norman Nicholson

Ladies and Gentlemen. I want you to know that I am proud and honored to be here with you today because in my opinion through these portals have just passed the sculptors of America's future - the Michaelangelos of America's tomorrow. Truly our future is in your hands. Are they strong hands? What are you going to do with this great responsibility?

First, we all know that the greatest counselor of all was Jesus Christ. The basics which he laid down must be your guide as a counselor. Love of people. You must have faith in people. You must have the desire to help them. You are your brother's keeper. Above all, you must believe in young people--really believe. If you don't feel this way, you're dead--as a counselor forget it. Other attributes of a counselor called for by the State of California Department of Employment in their occupational guidance descriptive bulletin: "Vocationa Counselor #381" are summarized as follows:

Vocational counselors serve people of all ages and conditions, helping them select and develop career goals. They deal with a more varied group than other counselors, and require the widest possible knowledge of people, community needs, job requirements, and industrial trends. This field is expected to expand greatly within the near future as a systematic program is undertaken to find income producing occupations for the many individuals who either have never found an opening in the current labor market, or who have been displaced from their jobs by the mechanized and/or automated processes which have eliminated many simple, heavy labor, or repetitive jobs.

School counselors help pupils still in the educational process in making and carrying out plans for their education and training for work. This has come to be such a widely accepted practice that nearly all schools provide at least a part-time counselor. However, the school counselor's time for each pupil may be limited, and up to the present time much school counseling has been college-oriented. This must be changed.

The basic objective of all vocational counseling is to help the individual seeking counsel to obtain enough knowledge about himself, his abilities and how they relate to the community and industry, that he may make his own decisions regarding work and plans for the future. The counselor is concerned not with giving advice but with giving information and identifying pertinent facts and conditions for the counselee to consider.

Much of the counselor's time is spent interviewing, both to get and to

give information. In public agencies the counseling objective may be to get the individual into productive employment as soon as possible, and the interviews are unusually limited in time and scope. In private agencies the focus is more often on a long-term goal pointed toward a life-time career, and extensive analysis and counseling may be involved, and a long look into the future is required.

The counselor helps the person seeking counsel to evaluate his capacities and preferences, and discusses with him the types of work suited to his qualifications. Places where such jobs may be found are pointed out, and the usual way of preparing for or applying for such work is indicated. If a long-range plan is sought by the counselee, he may return for subsequent interviews as long as he feels a need for further information. If immediate employment is the goal, the counselor tries to help the individual locate an opening for work.

Although a counselor must be understanding, he should strive to keep emotion, sentiment, and personal bias out of his work. He recognizes, evaluates, and, when necessary, points out, but does not criticize or recommend. Among qualities desirable in a counselor are tact, patience, and the ability to meet difficult or startling situations impersonally and matter-of-factly. He needs to be able to speak and express himself easily and effectively, and to write concise reports.

Second, you should know that industry now needs hundreds of thousands of vocationally trained personnel. Harold Johnson and I were talking and we decided many other industries should also be here today, such as 3-M, ABEX, the oil companies, supermarkets, Statham. They all need help in your orienting youth toward work in their companies.

U. S Steel Corporation's capital spending program is lagging far behind schedule. Reason: Lack of skilled employees.

Boeing and Douglas aircraft companies have been forced to delay jet deliveries. Reason: Suppliers can't find enough trained manpower to turn out engines on time.

Job openings for 2,050 electricians, machinists and tool-and-die workers which were opened last June in Bridgeport, Connecticut, according to the Wall Street Journal, were still open after June had come and gone. Reason: Only 287 men in the area had completed the necessary training.

Talley has gone to Europe and Canada on hiring missions.

These are just a few examples of how the current, severe shortage of skilled craftsmen is affecting the nation's industries. The labor department estimates that by 1975 four million workers with new skills will be

needed; only 255,000 are being trained right now. Yet, ironically, men are losing their jobs daily because their skills are obsolete. An the high incidence of unemployment in many of the nation's pockets of poverty is holding steady.

This is why the coming revolution in vocational education is, to borrow former U. S. Commissioner of Education, Francis Keppel's phrase, "a necessary revolution." Inspire them for this revolution.

These trends make the role of the vocational counselor more essential. Make your students feel needed. Make them feel wanted, they are important. Make them feel that way.

Third, you should know industry expects the public school system to do the vocational education job.

Manpower Research Council, Milwaukee, Wisconsin, has made a report compiled from information furnished by 930 companies throughout the United States. The participating companies had a total of 4,375,665 employees, an average of 4,705 per company. It is the feeling of the respondents that numerous institutions are at work in the community to provide skill training, but 60% feel that this training falls short of their company needs. This remissness is most serious in public high schools and public vocational schools, where many are not offering courses at all and many who are offering courses are not tailoring them to present-day business needs. This occurs despite the fact that local institutions are being provided with specific educational requisites. Participants in the survey expressed great willingness to serve on advisory boards to correct the situation. About 50% said they feel their universities lack adequate vocational training facilities and recommended public high school and in-plant training only as an emergency. An overwhelming percentage (over 85%) are in favor of development of public vocationally oriented technical colleges on a two-year basis.

Fourth, you should be knowledgeable on all matters about personnel industry needs, job descriptions, rates and trends of jobs and rates for the future.

Counselors must keep current with labor market information--both general information covering national needs and changing trends, and local information on existing jobs and probable future needs of the area. He needs to know the requirements and duties of all common jobs, and where to get authoritative information on the more unusual ones. He must be informed on labor laws and regulations--city, county, state, and federal. Many kinds of work require special licenses, health guarantees, and the counselor must be able to furnish all this information.

Counselors must be prepared to spend a great deal of time either talking or listening. They may be occasionally required to make visits to employers, and to attend meetings of civic, educational, and other groups.

Membership in professional societies is not a job requirement, but many counselors belong to the American Personnel and Guidance Association, or the International Association of Personnel in Employment Security.

The State Employment Service is a treasury of information--rely on Francis Bawden, Dorothy Castello and Tony Capritto.

Get in touch with Chuck Brady, Coordinator of Vocational Education, Ventura County Schools. Lean on him hard. If he doesn't know, he can tell you where to get the answers.

Industry wants to cooperate with you, to serve on committees to help you determine jobs to fill, jobs to sell your students.

Industry wants to help you build the stature of your job in Vocational Counseling and to pay you commensurate with your efforts. School administrators must get this message.

Fifth, industry wants you to know the nature of the multitude of vocations, trades and jobs it offers so well that you can relate the results of your student's aptitude tests directly to the logical jobs fitted to their aptitudes. The Dictionary of Occupational Titles by the U. S. Department of Labor is invaluable to acquaint you with job requirements. Industry wants you to know these backwards and forwards. Also skilled aptitude testing is a must.

Tests are a major tool of the counselor. A variety of tests have been developed by psychologists and educators to measure many characteristics which an individual may possess. Counselors must be familiar with all types commonly used tests in order to be able to interpret and evaluate the test results. Those most often used include intelligence tests (principally used by the schools), preference tests, aptitude tests, and physical performance tests (most often used by vocational counseling agencies). Private agencies frequently offer comprehensive tests, including types which explore personality factors as well as general intelligence and specialized abilities. Test results may indicate to a counselee the level of complexity at which he is best qualified to work, and fields where his natural endowments would help him succeed.

Counselors are responsible for the records kept on each counselee. These usually begin with a vocationally significant appraisal of the individuals seeking counsel--his background, education, work experience if any, physical abilities or limitations, and hobbies and preferences if any. If tests are administered, the test results are included

in the record and progress reports are added until the case is closed. The counselor may need to contact other agencies--schools, parole offices, medical clinics, or past employers--for information on the counselee's capacities and the extent of his employability. A young man with a history of asthma, for instance, regardless of other physical abilities or preference, should avoid work bringing him into contact with dust or fumes. A young woman on parole after a conviction for theft has no likelihood of obtaining work as cashier, regardless of her abilities, past experience, or preference.

One thing we know for sure about students--most of them need someone to talk with, someone to listen. We are good at that. It is a missing element in too many districts. Plenty of time for the bright articulate students. "No time for the Dummies."

So in counseling, listening and talking is important. Can't you just see your own desk with the stacks of folders on it. . .with all those lost identities in them and no time to handle them. What can be done about this? What can you do to bring this to the attention of your superintendent and board and get something constructive done to help this stack of lost souls? Industry wants to help you.

In the Portland Community College everyone is an advisor. The director is an advisor. The business manager is an advisor. The coach is an advisor. And still they say their biggest problem is to develop better skills in advising students, especially when they enroll so many dropouts in the area. These people have to have practice, and you can't let them practice without observation and guidance. It is guidance, guidance and counseling and advising, from before they come here, if they were in high school, until they finish a training program here, and then it might even continue after that.

Sixth, industry expects the vocational counselor to be a real manager. You have to be a self starter, a spark plug managing the cause of vocational education and selling it from the bottom to the top, inside and out. You have to get everybody for you: The school superintendent; the principal and staff; the students; parents; civic groups; the press. Yours is a great responsibility. You must keep the eternal fire of vocational education burning brightly at both ends of the candle. The eternal fire of Mt. Olympus is in your hands.

We live in a world which is changing at a startling rate. For a period of time spanning some 3,000 years, from King Solomon to George Washington, change was virtually imperceptible. The oil lamp provided light, the wood stove--heat, and the horse--transportation. About 150 years ago there began a ferment in discovery and technology, but it is the last two decades that have witnessed changes in science, technology but it is the last two decades that have witnessed changes in science, technology, and population multiplication in geometric progression.

In the single decade 1950-60 the population increased by 28 million. This is more than the total population of the nation at the time of the civil war. The year 1965 alone produced a million new eighteen year olds, ---and in 1966 we had more 18 and 19 year olds than we had during the entire 15-year period from 1950 up to 1965. It is predicted that during the present decade of the 60's, 26 million youth will enter the labor force and that 19 million of them will have no college experience.

What of the other side of the picture? Today, 92% of all the scientists who ever lived are alive and working. The lag between discovery and application is ever shortening. It took 20 years from the discovery of the vacuum tube to its application, 5 years for the transistor, and 2-1/2 years for the laser beam. Furthermore, we know full well from recent experiences that realization of the benefits of scientific discovery is contingent on the availability of a skilled and competent work force.

How can we reconcile a dichotomy where the unemployment rate among young people in their late teens and early twenties is higher than it was during the depression years, yet 4-1/2 million jobs go begging for lack of qualified applicants?

Recent national studies as well as those conducted in California indicate that, of every ten youngsters entering high school, approximately seven will graduate; of the seven only four will go on to some form of higher education, including the junior college; of this four, two will graduate from a four year institution.

It should be obvious that these two are the exceptional, not the usual, as you in education so often assume. What of the 80%, the unexceptional, these students of whom it is said, are in an educational system oriented toward someone else's college degree rather than their own work needs? These are the workers of tomorrow--the people who will carry a great proportion of the burden for the production and processes by which society maintains itself. Yet our major emphasis even now seems to be toward the needs of the exceptional 20%.

What has happened in this equalitarian society of ours that has led us to act and speak as if the only educational goal worthwhile is a college degree? Why do we imply that to fall short of this goal is to land on the trash heap? Why do we resist accepting the reality that <u>most</u> of the students will go directly into the world of work? What has happened to that which has made America GREAT--working with our hands and being proud of our hand skills. John Gardner, Secretary of Health, Education and Welfare, is quoted as say, "It is not the goal of a democracy that every citizen be the equivalent of a grand surgeon or a top executive; it is the goal of a democracy that every individual fulfill his own potentiality."

Also attributed to Dr. Gardner, if I may paraphrase it, is the statement that--"In a society where its philosophy permits a low esteem for plumbers and a high regard for philosophers, neither its plumbing nor its philosophy will hold water."

Now, I am not even remotely suggesting that vocational education is the panacea by which all of our social problems may be solved, but I am convinced that vocational education can play a significant role in preparing many of our young people for gratifying and rewarding careers which will contribute to the welfare of society.

Historically the status of vocational education has been permitted to diminish and has been generally demeaned in educational circles to be revived only when problems reach proportions of national crisis. This may be attested by such headlines as last week's L. A. Times cried out.. "Private industry asked to join U. S. job effort"; or, look at the whole reasoning behind the great society's Job Corps program--that was an emergency.

Oh, there is now a tremendous volume of verbiage directed toward vocational education, especially since the infusion of considerable federal funds, but there appears to be more lip service than substance to the support and real commitment to the objectives of vocational education. There is this subconscious classification of educational programs according to some previously conceived notion as to their respectability. By what rationale, for example, does a junior college feel compelled to maintain a class in engineering which can attract less than a half-dozen students, yet is reluctant to introduce a needed program in mechanical technology or one in cosmetology for which there is a demonstrated demand by students and employers. There is even a "respectability classification" among vocational education programs. We seem to be far more inclined toward instituting the more highly esteemed electronics or engineering technology courses, but frown a little at such plebeian programs as welding or typewriter repair.

On the other hand, some of our smarter thinking vocational people have upgraded their trade schools with stature inspiring titles: Seattle Community College and Portland Community College are two good examples of this forward thinking.

Portland Community College is truly a pace setter in the vocational education field. Highly individualized programs are the rule there, which means intensive counseling--a continuous guidance program. Keyed into this action the Portland schools have started a program of continuous counseling so that students will be ready for Portland Community College. They have a comprehensive guidance plan which continues from junior high thru grades 13 and 14.

Portland Community College has a full time person on its staff who keeps

the schools and students fully informed on the college's program. Their watchword is that "We will stick with a student through hell and high water." We'll see him through every course we have, if need be, to help him find something he wants and can do. We want to train this person to work for himself. We want to give him a sense of dignity, of usefulness, of purpose. The skills we teach are in demand today and will be in demand for awhile yet. We work at this, we know the labor market is changing and we change with it. We try to persuade students to not just concentrate on learning a single solitary skill, but to gain some understanding of an entire field, so they are able to move around in that field if their particular skill begins to go out the window.

Now, it is my opinion, that educational programs, be they college transfer, college preparatory, general, or vocational education, must be able to stand or fall on their own merits as to need, value and significance to our individual students.

What of these individuals and their needs? If it may be assumed that the eighteen year old of today will retire at the age of 65 (probably sooner); he will have worked until the year 2012, a 47-year span in the work force. This period will have seen many changes that will have affected his life. It is now estimated that he will have to be trained and retrained at least three and possibly five times during his working life. New developments in materials, methods, equipment, processes, and products hardly imaginable today, will affect all areas of industry and commerce and have tremendous implications for his education. It will become ever more imperative that students in vocational programs be provided with a broad, basic, and fundamental technical education, yet consisting of sufficient formal structure that will afford them the ability to "roll with the punches" as occupations, industry, and society changes. It will be necessary to provide these students with a basic kit of tools that will remain reasonably functional until the year 2012. We must take the long-range planning view point.

The realization that changes in technology will take place with increasing acceleration has caused some educators to consider <u>any specific</u> training as suspect. Exaggerated and distorted predictions have caused them to be fearful of teaching <u>anything</u> specific. Predictions such as were expressed by a recent banquet speaker that soon 2% of the population would produce all the needs of society have resulted in some highly erratic program planning. Incidentally, that speaker was nonplussed when asked how soon he thought he himself could dispense with the services of a plumber. You will recall the predictions during World War II. After the war there would be a helicopter in every garage, we would live in plastic houses, and prepared food would be delivered through a pneumatic tube from central kitchens. The war has been over for nearly a quarter of a century, and how basically different do you live?

There are several important factors in program selection and development

but there are two which are of paramount importance. The first of these requires the assistance, advice, council, and cooperation of the industrial and business community. The other entails a detailed occupational analysis of the contemplated field of training.

The arbitrary introduction of a new program based solely on the guesswork or best of intentions of school people or because it may have a prestigious sounding title is a sure path to failure. No one knows the demands for and requirements of a given occupation as do the practitioners, managers, employers, and community leaders. Therefore, the first step in program development is the organization of an advisory committee composed of such individuals. If after appropriate study the feasibility and support for a program is established--only then, and with the continuing advice and cooperation of an established advisory committee, should the school proceed.

Course content cannot be established by what we think the student should know. If we are really concerned with the welfare of students, we will be careful not to develop curricula based on what we think is good for him. I have seen the requirement of calculus imposed on students preparing for an occupation where algebra was more than adequate; and where no mathematics was required of a student preparing to be a die maker. The development of content and course requirements must be based on intensive study and analysis of the skills and knowledge required of successful practitioners in the fields. To encourage students to take still higher levels of course work is highly laudable, but to require it as a condition of participation is unrealistic, unfair and contrary to the objectives of vocational education. No vocational program will succeed unless it attracts students in sufficient numbers, and to attract students it will have to provide a reasonable probability of employment upon completion.

In the final analysis the primary evaluative criteria of vocational programs will inevitably be based on employability and placement of students. This is, after all, our main reason for "being in business." The day is long past where we can just "think" we are doing a good job. Those in vocational education have long been remiss in the follow-up of our students and a day of reckoning is not far off. From my observations the lack of placement, employment, and other exit data indicates a critical need for the development of systematized methods of gathering and cataloging such information. In order to maintain continuing evaluation and curriculum updating which is necessary to a dynamic program such information will have to be readily available for periodic studies.

Seventh, actually, industry's end requirements of you are simple--Give us people who are: First of all - Honest. We want an honest, truthful man. Second, they must possess that rare quality--the desire and will to work--that affirmative attitude and desire to work--they must have a good spirit. I recall my own experience with my Dad when I first was looking for a job--after some unsuccessful attempts, he advised me to merely tell them, "I just want to work." Third, they must know the rudiments of a trade or

vocation and these are the things we have been talking about for the past thirty minutes. They don't have to be the most brilliant boys in the world, just honest, and a good attitude and a great spirit for work and some measure of proven aptitude.

TOUGH!? I don't think so. But it is in your hands. You can do it. Industry is betting on you, and I think that is probably the most important thing a counselor should know about industry.

Ladies and Gentlemen, I thank you very much for your patience in listening to our story.

News media keep community informed about events and trends of key issues such as education and employment.

Industrialist Sees Vocational Education as Boon to Future

OXNARD — A leading industrialist told a group of county school counselors today, "that vocational education can play a significant role in preparing many of our young people for gratifying and rewarding careers which can contribute to the welfare of our society."

Norman Nicholson, vice president of Talley Corp., was one of the speakers at the day-long Occupational Information Conference sponsored by the Ventura County Vocational Resources Committee.

The conference, held at the Community Center, was attended by about 125 county high school counselors and representatives from county high school districts.

The Press-Courier
October 11, 1967

Nicholson said that the Labor Department estimates that by 1975 four million workers with new skills will be needed "and only 255,000 are being trained right now."

"Ironically," he said, "men are losing their jobs daily because their skills are obsolete."

"These trends make the role of the vocational counselor more essential," Nicholson said.

He said counselors should be knowledgeable on all matters dealing with industry personnel, — "job descriptions, rates and trends on jobs and rates for the future."

Nicholson said that the unemployment rate among young people "in their late teens and early twenties is higher than it was during the depression, yet 4.5 million jobs go begging for lack of qualified applicants."

First of its Kind

The conference, the first of its kind to be held in the county, is aimed at acquainting counselors with new trends in industry and occupations.

Dr. Al Powell, special consultant with the State Department of Education, predicted a 30-hour week with 13 weeks of vacation in the year 2000 "for the typical worker in the western world."

He said that within 15 years, two-thirds of the metropolitan population will have attended college, that "the experienced professional will go back to school for advanced training every two or three years, the survival of a firm will depend upon proper exploitation of brain power and that there will be increasing job mobility."

Dr. Powell said that a racent study of alternative methods of expanding programs for training vocational counselors revealed that additional funds should be provided by the legislature to public schools for these purposes:

—To improve the ratio of counselors and students.

—To improve and extend physical facilities and materials for guidance and counseling.

—To provide released time for counselors to work in the local community for the purpose of studying the labor market.

Specialist

—To provide for the assignment of a credentialled counselor in each secondary school as a full time specialist in vocational guidance.

—To provide counselor aides or guidance information technicians to assist the regular counselors.

Other speakers at the conference were:

Odessa Dubinsky, southern area labor market analyst with the Department of Employment, Los Angeles; Anne Lewis, supervising job analyst with the Department of Employment, Los Angeles; and Mack Stoker, regional coordinator, vocational education with the Department of Education, Los Angeles.

Francis Bawden, manager of the Department of Employment in Ventura, and Marvin Berson, president of the Ventura County Resources Committee, welcomed the group.

SECTION MEETING

GROUP I:

Resource Person:	Odessa Dubinsky
Discussion Leader:	LeRoy Andrews
Recorder:	Charles Brady

Some important points of this meeting:

A large number of new workers are entering the labor market. Many are women who are re-entering and youth who are entering for the first time. The shortage of experienced workers will become critical. We might be pushed into training these new workers at a more rapid rate and we might have more automation.

The returning veteran will create additional problems. He is a serious, conscientious individual who will probably return to school.

Occupational orientation should begin at an earlier age. Motivation appears to be a problem. This is difficult but made easier if the schools can go beyond the four walls and develop some attitudes through outside sources. Making a living is part of the life process.

If we train for job clusters, a worker who becomes unemployed in one job will move with less difficulty to another job within the cluster. He must have received substantial instruction in the basic skills and knowledge, however.

Industry regardstheir employees not so much as trade workers but as specialists. For example, because of the types of machines with which he works and the judgment and skills used, a machinist is considered to be a professional worker by industry. This is the motivation which can be used to influence youngsters. The machinists, pattern makers, precision metal workers and others like them keep the world turning.

If a youngster is not going to college, train him for jobs which do not require a college education. The Dictionary of Occupational Titles is a helpful tool which should be used in Scheduling and curriculum planning to indicate some of these jobs. Counselors must point out these facts to administrators.

Most schools are not doing what the Ventura County schools are doing in vocational education and guidance. Counselors must keep in touch with industry. In this way the schools will know the proper way of doing things.

More field trips to industry for teachers, counselors and youngsters were suggested by several participants.

One way to improve a vocational curriculum is to create an active and knowledgeable advisory committee of industrialist or similar people who can review the course content and make recommendations.

SECTION MEETING

GROUP II:

Resource Person: Mack Stoker
Discussion Leader: Harriet Woolley
Recorder: John Van Zant

Some important points of this meeting:

Programs can be developed in the high schools which can prepare students for immediate employment in a manner similar to the programs of the junior colleges. Examples of successful programs were cited. Discussion dealt with required interaction between the high school and the junior college for a successful vocational program in any community. In addition to this needed cooperation, another problem is scheduling of students.

Within the past year, 350 special credentials have been issued to industrial arts teachers who have completed a special vocational orientation program. Some schools have brought in businessmen and skilled workers to teach or advise some of the vocational classes. To be a successful teacher, a teacher must use many methods of teaching, sometimes all at once or in other combinations.

The Vocational Education Act of 1963 provides up to 25% of a teacher's salary and up to 50% of other costs of a vocational program.

Counselors and other school people need to know more about combinations of tasks and the skill levels for different jobs. They should also know the employers. And this information should be passed on to the students.

Some vocational education programs can be combined with work experience. Someone stated vocational education does not start soon enough. Mr. Stoker suggested that a follow-up be conducted on the 6th grade graduates. He also suggested that a comprehensive study of dropouts should be conducted with a limited number of factors which might indicate clues to prevent or reduce the dropout rate in the future.

Some shortage occupations in Ventura County were cited such as machine operator, nurse aide and other medical service jobs. A question yet unanswered is how directive can a counselor be in vocational guidance, especially since 99% of the student body truly believe they are college bound when in fact probably less than 40% will actually enter college.

Other problems discussed were extensions of the high school graduate who goes to work immediately after graduation, the returning veteran who

will return to school, training conducted in industry, demands by industry on the public school system, the one million people enrolled in vocational education in California, the role private schools are playing in providing vocational training and ways of attracting the attention of school administrators to the area of providing occupational orientation to students at an earlier grade.

The successful teacher is one who knows his youngsters intimately and who knows his community. The school system must get better acquainted with industry.

SECTION MEETING

GROUP III:

Resource Person: Anne Lewis
Discussion Leader: Harold Johnson
Recorder: John Stead

Some important points of this meeting:

Miss Lewis reviewed general and specific test development procedures including supervisorial evaluations and correlations. She also reviewed the Dictionary of Occupational Titles and the coding system. She expressly pointed out the worker traits section in Volume II.

Most youngsters have very little real and functional information about themselves and work. Perhaps we should start with counselors in the elementary grades and have them explore work in more detail. Require a student to set some goal, something specific for one year, then five years and as high as he wants to or believes he can go.

Job development for a specific student or a group of students and filling known job vacancies and the differences in these two situations were discussed.

Testing by employers is common place although the tests may or may not be valid and passing the test is no guarantee to either the employer or the worker. Employers must take a realistic view. Teachers and counselors should visit employers and get to know them and their policies. New industries are coming into the area which will create job opportunities within their own establishments and also in many supporting businesses and services. Education should do some fact finding about these plans and requirements of new industries and then do some planning to handle any educational needs which are recognized.

There are far more jobs than there are people who can fill them even though many people are unemployed. There is a gap between the job requirements and worker ability. Some of the traditional general education courses can be modified to the point where content will still satisfy administrative requirements but will be vocationally oriented such as in the fields of the physical sciences and math.

Women and their place in the labor market and the need for more job opportunities for them were subjects also discussed. More work must be done in this area as well as in the area of emerging and declining occupations. By using worker traits, counselors can automatically

eliminate some occupational fields and aim a youngster in other fields. A problem in the comprehensive high school is to motivate the student so that he wants to learn. Unless he is given a realistic occupational goal he may be lost.

Communications in industry-education-employment must be improved. Educators and counselors must get out more into the community. Education should place specific demands on industry and employment.

SECTION MEETING

GROUP IV:

Resource Person:	Dr. Al Powell
Discussion Leader:	Madeline Miedema
Recorder:	Lois Shaffer

Some important points of this meeting:

Suggestion that more vocational education can and should be offered at the junior high school level.

Dr. Powell reviewed in more detail several of the programs to which he referred in his speech, such as Life Career Games, interagency cooperation and Employment Readiness.

Discussion centered around meeting requirements of the state and local districts and at the same time including some of these special programs in the curriculum.

Though there seems to be some correlation between the Differential Aptitude Test and the General Aptitude Test Battery, there has never been any validation with the DAT on the basis of success on the job. This has been done with the GATB. Dr. Powell believes the GATB for use by school people is an excellent tool and he believes there is nothing better though he feels it is expensive and requires some appreciable time. He further believes in selective use rather than wholesale application. The Department of Employment has trained Ventura County school counselors in the use of the GATB.

Find time in the curriculum for giving a youngster a planned program. As a pilot, try summer school. Another possibility is a Guidance Club which includes vocational guidance but is not necessarily limited to that area.

Youngsters need guidance. Fifty percent (50%) of those who enter the 7th grade will enter the labor market immediately after leaving school, either because of graduation or dropping out, and these terminal students will change jobs seven (7) times before hitting upon their line of work.

One way to get career and guidance information into the schedule is to work it into such classes as English and typing. Research indicates much of what youngsters type rubs off on them unless it is meaningless nonsense.

An example of a vocational education class with substance is one which used a Briggs and Stratton engine, probably 2 h. p., one engine for each two students, each engine cost $31. Students learned about the electrical and fuel systems and other parts of an internal combustion engine. Another example was a class in electricity which used ten small home appliances as training aids.

Counselors should do more planning and identify the important points of a program and then prepare a calendar for a year. Industrialists should be invited to speak to classes and counselors and students should go into the field and visit the industrial community.

A statewide GATB maturation study is now in the fifth and last year and the results will be released soon.

EVALUATION

Conference participants were asked to evaluate the conference in terms of whether the information presented met their needs. Sixty-three persons responded to the evaluation questionnaire sent to them. The questions asked of them and their answers appear below:

1. Do you think the conference was worthwhile?

   49 answered yes; 8 answered no; 6 answered yes with reservation

2. What was the most valuable aspect of the conference?

   Comments and number of similar answers appear below:

   8 answered: "Information presented by the morning speakers."

   8 answered: "Afternoon section meetings where individual school counseling problems could be discussed with speakers."

   4 answered: "Information relevant to the use of the Dictionary of Occupational Titles."

   12 answered: "Dr. Powell's lecture concerning the hows and whys of vocational counseling."

   9 answered: "Opportunity to evaluate the opinions of business and industry relating to the school's and counselor's role in preparing the student to enter the 'world of work'."

   9 answered: "The participants became more aware of the importance of vocational training in preparation to live in today's world."

   6 answered: "Information pertaining to the role of the California State Department of Employment in Vocational Education."

3. Do you have any suggestions which could be used in formulating plans for any future occupational information conferences?

   Comments and number of similar responses appear below:

   6 suggested: "More time should be allotted for small group meetings."

7 suggested: "Information of a more realistic nature should be given to participants as to just exactly what the counselor can do within the framework of his or her school to improve his or her image as a 'vocational counselor'."

1 suggested: "Next year let's stage a role playing activity, such as a new employer moving into the area, or an existing employer who has a new job skill need. Schools officials would demonstrate curriculum development. A narrator could then review the entire operation and point out that this is an example of direct vocational education combined with general education."

7 suggested: "Arrange for Dr. Powell to spend half a day with county counselors. In this way he would be given enough time to discuss with conference participants vocational guidance projects throughout the state."

4 suggested: "Provide rebuttal time for school counselors to reply to business and industrial leaders' demands."

1 suggested: Next time include teachers as participants."

2 suggested: "Next time invite administrators as well as counselors."

8 stated: "Occupational information as to numbers and kinds of job openings available to high school and junior college graduates in Ventura County should be given to counselors. The conference provided general information only."

2 stated: "Most of the information presented in this conference was high school oriented. Next time the junior college's role in vocational guidance should also be presented."

4 suggested: "Give the luncheon speaker more time to deliver his speech."

1 suggested: "Present a picture of what is being done in vocational counseling at present in schools of Ventura County."

1 suggested: "Present information on what the junior high school counselor can do for the potential school dropouts."

1 stated: "Apprenticeship information should be made available to conference participants."

2 suggested: "Speakers should be given an orientation tour of schools before they make up the individual content of their speeches."

Final Evaluation Conclusions

For a first effort, in terms of providing counselors information about the world of work, apparently the Vocational Resources Committee was successful, however many suggestions were made, as the reader notes above, for improvement. The next Occupational Information Conference planning committee will consider these suggestions and will endeavor to plan a more informative day for Ventura County school counselors.

*PROGRAM GUIDES; *VOCATIONAL AGRICULTURE; *AGRICULTURAL ENGINEERING; *COCURRICULAR ACTIVITIES; STUDENT PROJECTS; *EXHIBITS; HIGH SCHOOLS
*AGRICULTURAL MECHANICS PROJECT FAIRS

Developed by an area agricultural education advisor for use by teachers of vocational agriculture in planning and conducting an agricultural mechanics fair, this activity guide may be used to promote a high school agricultural production or agricultural mechanics program. The content includes sections relating to: (1) fair plan development, (2) obtaining approval, (3) selecting the superintendent, (4) time and place, (5) rules, (6) budget, (7) class description and premium schedule, (8) publicity, (9) conducting the fair, (10) special features, (11) selecting judges, (12) score card, (13) entry blank, (14) entry tag, (15) record keeping system, and (16) evaluation. The appropriate student occupational focus is agricultural mechanics in an area of comprehensive high school in the northeast United States. (DM)

Mr. Charles F. Lebo, Area Advisor of Dauphin-Schuylkill Counties, prepared this Manual for Planning and Conducting an Agricultural Mechanics Fair in the Ag. Ed. 422v course under the direction of Dr. Frank Anthony, Associate Professor of Agricultural Education, The Pennsylvania State University.

An Agricultural Mechanics Fair provides competitive activities which reflect special abilities and areas of emphasis needed in the education of a successful agriculturalist.

It is our hope that this publication will aid you in promoting educational activities like this in your school and county.

INTRODUCTION TO THE MANUAL

This manual has been prepared to assist in the planning, development and operation of an agricultural mechanics project fair for students studying vocational agriculture and members of the Future Farmers of America.

Vocational agriculture students have constructed and repaired many types of agricultural mechanics projects as a part of their training and development while studying vocational agriculture. Few people have had an opportunity to see their fine work and craftmanship. These students should have an opportunity to display their projects and enter them in a competition with other vocational agriculture students.

Youth Activities Groups and FFA Agricultural Societies have funds to promote this type of activity. This manual is designed to assist these groups in organizing and conducting agricultural mechanics projects fairs in their respective counties and local FFA Chapters. This activity conducted as a fair will provide opportunities for FFA members to develop leadership, cooperation and provide inspiration for those who compete. This activity will provide an opportunity for the entire community to observe the work of the students.

SPONSORING FFA AGRICULTURAL MECHANICS PROJECT FAIRS

A County Youth Activities Group or an FFA Agricultural Society have the financial resources and the responsibility for providing competitive activities for Future Farmers of America which promotes Agriculture and Agribusiness. By sponsoring an agricultural mechanics project fair, farm and business interests are served.

A large portion of vocational agriculture instructional time is devoted to agricultural mechanics. All students have the opportunity to construct and repair numerous items used in the farm, in a business or in the home. All FFA members could participate in this activity.

When an agricultural society decides to sponsor this fair activity many objectives could be listed for supporting the function. The following lists of objectives or benefits may serve as a guide for sponsoring the event:

1. To provide a plan for the students to exhibit their agricultural mechanics projects.

2. To develop students interest and pride in their agricultural mechanics work.

3. To help the community to better understand the vocational agriculture mechanics program and the achievements of the students.

4. To develop better school and community understanding.

5. To provide opportunities for students to develop their leadership abilities.

6. To promote interest of prospective pupils in vocational agriculture.

7. To advance vocational agriculture.

8. To promote desirable parent and son relationships.

9. To provide opportunities for exhibitors to exchange ideas and plans.

This list may not meet every situation and need. Societies are encouraged to develop their own objectives, using those listed above as a guide.

DEVELOPING THE FAIR PLAN

Before proceeding directly into administrating an agricultural mechanics project fair, an outline of operation should be developed to plan the fair. This outline will include many or all of the following items:

1. Obtain board of education and administrative approval.

2. Select a superintendent or fair committee.

3. Select a time and place.

4. Prepare a budget and fair rules.

5. Develop a class description and premium schedule.

6. Prepare a list of fair rules.

7. Prepare publicity for students and the public.

8. Conduct the fair.

9. Plan special features for the fair.

10. Select judges.

11. Prepare score card and judging rules.

12. Develop Entry Blanks and Entry Tags.

13. Develop record keeping system for entries and premium.

14. Prepare publicity on results.

15. Pay premiums.

16. Evaluate the fair.

This manual provides information for planning and conducting an agricultural mechanics project fair for each area listed above.

OBTAINING BOARD OF EDUCATION AND ADMINISTRATION APPROVAL

All Future Farmers of America Chapters that plan to have their members compete in the agricultural mechanics project fair should notify their local school administrator of their intentions to participate in the fair and

obtain his approval. All information available pertaining to the fair should accompany the request to the administrator, so he will be fully informed relative to the purpose and value of the fair. The administrator will inform the local board of education and others concerned with the final approval.

Schools selected to act as hosts for the fair should prepare a special request, since the school facilities, school personnel and students will be involved in conducting and operating the fair.

SELECTING THE SUPERINTENDENT OR FAIR COMMITTEE

It will be necessary to have a superintendent or fair committee selected to plan and conduct the fair. Usually the chairman of the fair committee acts as the superintendent for the project fair. This committee is responsible for developing fair rules, planning the class and premium schedule, and conducting the fair. After the committee developes the fair plan, they should report their action to the sponsoring organization for final approval and adoption.

The host school's vocational agriculture instructor is an excellent choice for fair superintendent because of his availability to the facilities. His duties will include: making local arrangements, receiving entries, keeping entry records and general fair control. Other specific assignments can be added to this list or delegated to other fair committees. A smooth operating fair depends largely upon the time and efforts of these persons.

SELECTING A TIME AND PLACE

Because of school and community differences no one can say just when a Future Farmers of America agricultural mechanics project fair should be held. However, since the fair involves the agricultural mechanics projects which have been completed in the vocational agriculture shop, April or May would be the most desirable months in order to have the best selection of project exhibits.

For best results the project fair should be scheduled with a Future Farmers of America activity or school function where the public is invited. A spring open house of a high school would be an excellent time to exhibit and have a competition for the students. Many schools have this event to show the public the work of the students. If only one high school has an open house in the county, project exhibits from other schools could be transported into this school for the competition. Arrangements should be made to have the larger projects exhibited and judged at the school in which they were constructed or repaired. The judges could complete the judging of these larger projects in the morning, moving from school to school and in the afternoon, judge the smaller projects entered in the school designated as the fair location.

Modifications can be developed to supplement this plan based upon the local situation. However, all agricultural mechanics projects completed during the year should be given consideration for this project fair.

DEVELOPING FAIR RULES

The following list of rules and regulations is provided for the development of a smooth operating agricultural mechanics project fair:

1. Competition is limited to vocational agriculture students of_____ County unless specified otherwise.

2. Any active member of the Future Farmers of America shall be allowed to exhibit as long as he holds membership in the Future Farmers of America.

3. All exhibits are entered free.

4. Every exhibitor shall give the class, name and other information pertaining to his exhibit to the committee or person in charge upon entering the exhibit.

5. An exhibitor shall not receive more than one premium in any particular class or subdivision of a class except as otherwise specified in the official rules.

6. No identification marks shall be left on any article exhibited in competition until after judging. Exhibit tags shall be furnished.

7. All articles on exhibition must be respected as private property and any person detected in purloining or injuring them will be dealt with according to law.

8. The project exhibited must be done by the exhibitor in the school shop. Entries must be actual projects.

9. The sponsoring agency assumes no responsiblity in case of loss or damage to any exhibit. Exhibitors must conduct their business or exhibit in such a way that the public shall not be liable to injury.

10. Exhibits shall be entered and placed from_____ a.m. or p.m. to _____ a.m. or p.m. on_____ (day or week),_____ (month), _____ (date).

11. Exhibits will be judged on _____ (day and time).

12. All exhibitors shall call for their exhibits on or before _____ (time and date).

13. All entries will be judged on quality. If there is no competition, premiums will be decided by the judges.

14. Judges will not award prizes to an unworthy exhibit.

PREPARING A BUDGET

A very worthwhile and successful agricultural mechanics project fair must be adequately financed. Funds provided by the society or group depend largely upon their attitude toward the importance of this particular fair function. This fair provides an opportunity for all boys completing projects in a vocational agriculture shop program to compete. Participation could be relatively high and competition keen. Premiums should be paid for the competition and ribbons awarded and placed on the judged exhibits.

Consideration must be given to the number of entries, classes and the judging system to be used. If the Danish System is used the premium cost may be higher than if the exhibits are placed in a decending numerical order. The fair committee should make recommendations for premiums. The cost of judges and other administrative expenses should also be considered. Societies presently conducting agricultural mechanics project fairs should budget between two and four hundred dollars for the event.

SUGGESTED CLASS DESCRIPTION AND PREMIUM SCHEDULE

This schedule has been developed as a guide for planning agricultural mechanics project fairs. Classes should be designed for local situations and agricultural mechanics instructional emphasis.

CLASS I Construction of large agricultural equipment. Examples: Wagons, trailers, elevators feed bunks, range shelters and other large farm equipment.

1st	2nd	3rd	4th	5th	All Others
$14.00	12.00	10.00	8.00	6.00	4.00

CLASS II Repair of large agricultural equipment. Examples: Tractors, harvesting, tillage, seeding, and other large farm equipment.

1st	2nd	3rd	4th	5th	All Others
$14.00	12.00	10.00	8.00	6.00	4.00

CLASS III Construction of small agricultural equipment.

1st	2nd	3rd	4th	5th	All Others
$6.00	5.00	4.00	3.00	2.00	1.00

CLASS IV Repair of small agricultural equipment.

1st	2nd	3rd	4th	5th	All Others
$6.00	5.00	4.00	3.00	2.00	1.00

CLASS V Construction, maintenance and repair by welding.

Division A - Steel
Division B - Hardsurfacing
Division C - Cast Iron
Division D - Brazing

Premiums awarded in each division.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS VI Tool Fitting.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS VII Sheet Metal Work.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS VIII Cold Metal Work.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS IX Wood Lathe Work.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS X Metal Lathe Work.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS XI Rope Work.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS XII Painting, Glazing and Refinishing.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS XIII Plans, Drawings, Designs, Cost Estimates.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS XIV Concrete Work.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS XV Construction of Household Equipment.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

CLASS XVI Miscellaneous Agricultural Projects.

1st	2nd	3rd	4th	5th	All Others
$5.00	4.00	3.00	2.00	1.00	1.00

Premiums must be based upon the budget established for the event and the estimated participation. This suggested premium will cost over $350.00 if all classes are filled with no amount included for the "All Others" category. Ribbons, judging and other operational cost must also be considered.

The "All Others" category for awarding premiums is included to provide additional awards to worthy exhibits. This category should provide an added incentive to the exhibitors. The premium schedule is designed to recognize the work students undertake in constructing and repairing large agricultural equipment. The fair committee or superintendent is responsible for developing a plan for placing the exhibits in particular classes in which they are eligible to compete.

PREPARE PUBLICITY FOR STUDENTS AND THE PUBLIC

Early in the school year the students should be informed that an agricultural mechanics project fair will be held for their participation. Students may then plan their project work to meet the scheduled fair. The students should discuss the fair at home and with friends or neighbors. Early publicity and promotion of the fair will net a larger number of projects, exhibits and a larger attendance.

Several weeks before the project fair, publicity should be prepared about the fair and distributed to the various news media in the area. This publicity should be designed to inform the public of the forthcoming fair and encourage students to prepare their projects for exhibit.

CONDUCTING THE FAIR

This manual is designed to provide information for the development and operation of an agricultural mechanics project fair. The various areas of fair administration are outlined in the manual to provide the sponsoring organization with a guide to follow in administering the fair.

The success of the agricultural mechanics project fair depends largely upon the time and effort devoted in planning and arranging the event. All persons in charge of the fair should be briefed on their duties and their responsibilities for carrying out the assignments. The persons in charge of the exhibits should be on hand before the exhibits arrive to prepare the facilities for the exhibits.

After the exhibits are in place and judged FFA members should be available to greet the people attending the fair and to answer questions pertaining to the activity. Special features which were planned should be available to add to the total program.

The facilities should be kept neat and clean and the exhibits should be displayed to develop a desirable impression for the department and the Future Farmers of America.

PLANNING SPECIAL FEATURES FOR THE FAIR

A fair organization may find it convenient to plan special entertainment or other activities during the fair. This list may include:

1. Window exhibits
2. Agricultural displays
3. Agricultural demonstrations
4. Motion pictures
5. Short rides for the children
6. Special musical entertainment
7. Agricultural guessing contests
8. Special drawings
9. Refreshment stand
10. Machinery exhibits
11. Nail driving contest
12. Log sawing contest

Many other events may be planned to supplement the project fair based upon the local situation. For successful special fair features a special committee should be selected to insure a successful program. If special features are planned, costs of these events must be included in the budget.

SELECTING JUDGES

Judging the project exhibits is a very important part of the fair, especially to the exhibitors. Individuals selected to judge the exhibits should have a knowledge of agricultural mechanics and the various aspects of the vocational agriculture instruction in agricultural mechanics. The following list of persons may serve as a guide for the fair committee:

1. Vocational agriculture instructors who have no students in competition.

2. Area advisors of vocational agriculture.

3. Electric power company representatives.

4. Industrial arts instructors.

5. Lumbermen.

6. Agricultural machinery and equipment dealers.

7. Educators who have a knowledge of agricultural mechanics.

8. School Directors.

9. Area vocational directors.

10. Farmers.

This list is by no means complete. However, it is recommended that the fair committee secure at least two judges for the event and possibly three.

The superintendent should brief the judges on their assignment and review the class and premium schedule to avoid confusion while judging. The score cards should be reviewed and explained to them. The fair rules should also be discussed at this time. All other administrative details concerning the judging of the event such as: preparing travel vouchers, breaking ties, awarding premiums, and other important considerations should also be discussed.

A clerk should accompany the judges while they are judging the exhibits to keep records of the placings.

VOCATIONAL AGRICULTURE MECHANICS JUDGING SCORE CARD

Class Name_____ Class No._____

Judge's Name_____

JUDGING CATEGORIES	VALUE	ENTRY NUMBERS									
Type and Condition of Material	10										
Degree of Difficulty	10										
Plan and Dimension Followed. (Construction Projects)	10										
Finish	5										
Workmanship	15										
Total Scores	50										
Final Placings											

EXPLANATION

TYPE AND CONDITION OF MATERIAL - Includes correct materials used, quality of material used and free of defects for the project.

DEGREE OF DIFFICULTY - Consideration is given to the amount of work and number of different skills used in completing the project.

PLAN AND DIMENSION FOLLOWED - Used in construction projects where plans are submitted with the project. There is evidence that plans have been followed.

FINISH - Consideration is given to the correct finish, degree of finish and the appearance of the finish of the project.

WORKMANSHIP - Consideration is given to the quality of the project or the professional appearance of the work.

PROJECT FAIR ENTRY BLANK

Name_____
Address_____
School_____

I HEREBY MAKE THE FOLLOWING ENTRIES:

Exhibitors Number_____
Filled in by Superintendent
Entry Date_____

ENTRY TAG

Exhibitor's No._____
Class No._____
Exhibitor's Name_____
School_____
_____
Name of Exhibit

PROPERTY CHECK

Exhibitor's No._____
Class No._____
_____
Name of Exhibit

DEVELOPING A RECORD KEEPING SYSTEM FOR ENTRIES AND PREMIUMS

The law governing the use of fair funds requires the organization sponsoring these activities to keep records. A permanent record of all entries and premiums awarded to each exhibitor must be kept. The information secured from the entry blanks should be copied into this book for the permanent record. After the judges have completed placing the exhibits the final results may be entered into the book for each exhibitor. Entries in the record book may be made by classes or by exhibitor's name and number. Each exhibitor should be paid by check from sponsoring agencies fund.

PREPARING PUBLICITY ON RESULTS

During and immediately after the fair pictures and news of worthy activities should be compiled by the fair committee. Local newspapers, large circulation newspapers, state publications and other news media are eager to provide coverage for these activities. A complete list of winners should be developed with photographs taken of the students or their projects. This information should be gathered for distribution immediately after the fair. Good news articles help to stimulate the interest of the students and also serves as a means to inform the public of the work of the vocational agriculture department.

PAYING PREMIUMS

Premiums and other expenses incurred by the sponsoring organization should be paid no later than two weeks after the project fair. Payment should be done by check to facilitate final auditing and record keeping.

Ribbons awarded the exhibits should be attached to the exhibit after it is judged. The exhibitors will then have their ribbon when they call for the exhibit. Students receiving premium checks should be encouraged to cash their checks immediately after they receive them to avoid confusion later in the year.

EVALUATE THE FAIR

Immediately after the project fair, the fair committee should meet and and evaluate all aspects of the fair. Successful activities should be noted and recommended to be included in the next project fair. Activities that need to be improved should be noted also. The various phases of the fair which need to be reviewed should include the following:

1. The number and quality of the exhibits.
2. The budgeting of funds.
3. The class and premium schedule.
4. The function of the superintendent and fair committee.
5. The attendance by the public.
6. The value and effect of the publicity before and after the project fair.

7. The methods of judging.

8. The facilities and the local preparation.

9. The special features program.

10. The time and place of the fair.

All of these areas should be reviewed in planning for next year's fair.

It is hoped that more FFA Agricultural Societies will help to sponsor and support an Agricultural Mechanics Project Fair for the students in vocational agriculture in their area.

Fairs of all types need careful planning for desirable results. By using this manual, a successful agricultural mechanics project fair may be conducted for the benefit and satisfaction of all.

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

INTRODUCTION

The primary objective of this research project is to examine the unemployment and re-employment experiences of the population of 1,184 engineers and scientists who were laid off by 62 defense-oriented firms in the San Francisco Bay Area during the 18-month period ending March 31, 1966. This study, in addition to describing the magnitude of the layoff problem, analyzes (a) the job search activities of laid off engineers and scientists, (b) adequacy of income sources during the period of unemployment, (c) problems of transferring from defense to commercial jobs, and (d) impact of age, education, pre-layoff salary, etc. on re-employment.

The preliminary data consisting of names, addresses, telephone numbers, age, salary, area of specialization, and educational background of the subjects were derived from company files, files of the California State Department of Employment, Technical Placement Co-op files, and friends of laid off engineers and scientists. The major data for this study were obtained by means of a pretested mail questionnaire. A net response rate of 74 percent was obtained.

PREFACE

The material in this report was prepared under a contract with the Office of Manpower Policy, Evaluation, and Research, U. S. Department of Labor, under the authority of Title I of the Manpower Development and Training Act of 1962, as amended. Researchers undertaking such projects under government sponsorship are encouraged to express freely their professional judgement. Therefore, points of view or opinions stated in this document do not necessarily represent the official position or policy of the Department of Labor.

This study, which was started in April 1965, has been conducted under U. S. Department of Labor Contract No. 81-04-27 and guided by Mr. Robert E. Manifold, Chief, Manpower Research Contracts Group, and Mr. Richard L. Fogarty of the Manpower Research Contracts Group, who gave continuous direction to all phases of this study.

This author is indebted to many individuals, in the Department of Labor, in the California State Department of Employment, and in the companies studied, for their active support and interest. He is particularly grateful to Dr. George S. Roche, Chief of Research and Statistics, California State Department of Employment for his assistance in obtaining the preliminary data for this study.

The author wishes to thank his colleagues at San Jose State College for their support, aid, and criticism. He wishes to especially thank Dr. Alvin Rudoff for his assistance

in the preparation of the final report, Miss Susan Admire for her help in field work and secretarial support, and Mr. R. C. Malhotra for his data processing and computer programming support.

Finally, the author would like to thank Drs. William G. Madow and Edwin B. Parker for their valuable consultations and expert advice in various phases of the study. Special thanks are due Mrs. Joanne K. Loomba for her collaboration in preparing Chapters III and VI of this report.

Engineering

MAJOR FINDINGS

The analysis presented in the main report has brought to the forefront many facts, which, heretofore, either were not known or had remained unsubstantiated. The following is a list of the major findings.

1. Transfers from Defense to Commercial Work

Shifts from defense to commercial work are quite common among engineers and scientists. On the average, 38 percent of those who change jobs transfer to commercial work. Subsequent to the most recent layoffs, 54 percent of the respondents shifted to commercial work. The median duration of commercial jobs, as of November 30, 1965, was 13.5 months. Engineers and scientists who transferred to commercial jobs were working on assignments involving industrial gear design, medical electronics, industrial process control, automotive engineering, etc. Respondents who received salary increases had been on their commercial jobs for a longer period of time than those who received salary cuts.

A comparison of the personal characteristics shows that engineers and scientists who transferred to commercial work are relatively less educated, younger, and receive lower prelayoff salaries than those who did not transfer. Moreover, the transferred group read fewer technical magazines, take fewer courses offered at work, and are members of fewer professional societies than the not-transferred group.

2. Age and Re-employment

The hiring policies of employers appear to be discriminatory towards older engineers and scientists. Irrespective of their educational background, pre-layoff salary, technical publications, patents, readership in technical magazines, and membership in professional societies, older engineers and scientists remained unemployed for a much longer period of time. Moreover, the influence of age on the period of unemployment increases as the educational level of the respondents goes down.

For respondents with different educational background, step-wise regression analyses were carried out with period of unemployment as the dependent variable and age, industrial experience, and salary as independent variables. The results show the regression coefficients for age for the non-degree, B.S. degree holders, and M.S. degree holders are .497, .138, .042 respectively. The first two coefficients are significant at the .01 level. In the case of M.S. degree holders, the highest regression coefficient (-.607) is obtained for salary. This coefficient is significant at the .01 level. It appears that obtaining an advanced degree is one of the ways of counteracting the dysfunctional effects of old age.

3. Duration of Unemployment

Subsequent to their layoff, engineers and scientists remain unemployed for a considerably long period of time. For the San Francisco Bay Area, the median period of unemploy-

ment for the laid off engineers and scientists is 12 weeks. Approximately one-third remained unemployed for 18 weeks or longer, and 6 percent were without a job for more than one year.

The period of unemployment is independent of educational background, publications, patents, readership of technical magazines, courses taken at place of work, adult education and/or workshop courses completed in engineering or science, and membership in professional societies.

4. Company Layoff Policies

4.1 Layoff Criteria

Defense-oriented firms in the San Francisco Bay Area appear to have laid off engineers and scientists primarily on the basis of their age. For example, 33 percent of the laid off engineers and scientists are 45 years of age or older. In view of the estimate that 17 percent of the industry's engineers and scientists are 45 years of age and above, proportionately twice as many engineers and scientists who are in the 45 years plus category were laid off. When educational background, technical publications, patents, membership in professional societies, and number of engineering and scientific courses completed at work are considered, there is no statistically significant difference between laid off and working engineers and scientists.

4.2 Length of Advance Notice

The defense employers do not give a reasonable advance notice of pending layoffs to engineers and scientists. One-

half of the engineers and scientists who were laid off by 62 defense companies in the San Francisco Bay Area received advance notices of 7.58 working days or less. Fourteen percent did not receive any advance notice whatsoever of their forthcoming layoff.

Seniority of the respondents had no influence on their time of layoff. Subjects who had been with their employers for five years or longer were laid off at approximately the same rate as those who had been with their firms for two years or less.

5. Job Search Methods

Sending direct applications to companies is the most efficient method of obtaining engineering and scientific jobs. Friends and personal contacts and newspaper advertisements are the second and the third most efficient methods of seeking re-employment.

Out placement services offered by employers is not a commonly used method. However, it is the fourth most efficient method of obtaining jobs. Private employment agencies, State of California Department of Employment, services of professional societies, and trade and professional magazines are less efficient than the outplacement services of the employers.

A large majority (61 percent) of the unemployed engineers and scientists normally visit the State of California Department of Employment for the purpose of seeking jobs. However, only a few of these individuals are successful in obtaining jobs by this method.

6. Sources of Financial Assistance

Unemployment insurance is the most commonly used and the most important source of financial support for unemployed engineers and scientists. Approximately 74 percent of those who remained unemployed used this source of financial assistance. Even though unemployment insurance is the most commonly used, and the most important source of financial support, it is not an adequate source. For instance, 51.4 percent of the engineers and scientists who remained unemployed for four weeks or less, had to liquidate their savings and investments.

The fact that an individual receives unemployment insurance does not make his job search activities inferior. On the contrary, engineers and scientists who used unemployment insurance were more active in their job search efforts than those who did not use unemployment insurance.

7. Non-degree Respondents

Attending college and/or a university and completing pertinent courses is the most commonly used method (46%) by non-degree engineers and scientists for achieving technical competence. Self-motivated reading and on-the-job practical experience are the second and the third most important means of achieving engineering and scientific competence.

8. Geographical Mobility

Massive defense layoffs normally result in sizeable out-migration of engineers and scientists from the general area. For instance, subsequent to their recent layoffs, 38 percent of the laid off engineers and scientists left the San Francisco Bay Area, and 21 percent left the State of California.

The engineers and scientists who left California were younger, had obtained higher levels of education, and had received their formal degrees more recently than those who did not leave the state.

Since the 1964 layoffs, the in-migration of scientists and engineers to California has slowed down and the out-migration has accelerated.

9. Salary and Job Changes

The most common reason for which engineers and scientists change jobs is higher salary. More interesting work and layoffs are reported to be the second most frequent and the third most frequent reasons for job changes. In general, 45 percent of those who change jobs receive salary increases. Under poor business conditions, this proportion drops to 21 percent. The proportion of those receiving salary cuts varies from a low of 10 percent under good business conditions, to a high of 28 percent, under poor business conditions.

OBSERVATIONS AND RECOMMENDATIONS

The findings presented in the first ten chapters of the main report are based on the analysis of the 876 questionnaires completed by engineers and scientists who were laid off by 62 defense companies located in the San Francisco Bay Area. In addition to the computations reported in this study, the author has analyzed the detailed comments submitted by these respondents on several open-ended questions. He has also conducted personal interviews with 150 laid off engineers and scientists.

Furthermore, the author has interviewed personnel managers and key executives of 53 of the 62 defense firms involved. This constitutes interviews with the management of 86 percent of the defense companies which had engineering and scientific layoffs. Moreover, he has interviewed personnel managers and key executives of 22 commercial firms.

Observations on Causes of Defense Layoffs

On the basis of the above mentioned interview efforts, as well as the data collected by the 876 questionnaires, the author has compiled the following list of reasons for the instability of defense-oriented engineering and scientific employment.

1. One of the main reasons for engineering layoffs is the periodic cutbacks and shifts in defense spending. It was reported by many interviewees that some of the major shifts in defense spending, to some extent, have been political. One individual commented:

> The government has no regard for the stability of engineers. Each political party and each president have their own idea as to which part of the country will get big government contracts. This causes hardships, unemployment, layoffs, and a constant movement of personnel.

When asked to provide evidence in support of this feeling, the interviewees presented copies of several daily newspapers giving news of layoffs in the San Francisco Bay Area in the first section and giving large advertisements for engineers and scientists in Alabama, Louisiana, and Texas in the want-ad section.

2. Personnel managers from several companies pointed out that, at times, the Department of Defense has cancelled large defense contracts involving thousands of workers at unreasonably short notice. It was maintained that the companies cannot absorb such large scale cancellations without mass layoffs unless the companies themselves receive a reasonable advance notice.

3. Poor manpower planning on the part of certain company managements is another reason which leads to engineering and scientific unemployment. Some interviewees felt that a company should not accept a large contract, if the manpower and the facilities available are inadequate. They cited examples of companies which accepted extensive contracts and then hired workers to the extent of establishing a growth rate of more than 100 percent. Such growth rates, in the opinion of some executives, are too excessive and lead to instability both for the company, the community in general, and the engineers and scientists involved.

It was pointed out that there are companies, both small and medium sized, in which the managements emphasize the "oversold" position of their companies' manpower and facilities. In such cases, once the company's resources are committed for one year or longer on certain contracts, the management would not accept additional work. Furthermore, these companies hire professional engineers with great care and with a view of providing them with permanent employment. The growth rates for such companies are between 10 and 15 percent per year.

4. Some of the existing practices in the defense industries are important factors in creating engineering employment instability. As an illustration, consider project "P", with estimated cost of $900,000,000, for which the Department of Defense has asked for bids from throughout the country. For the sake of argument, let us assume there are four companies named B, C, D, and E bidding for project "P".

As one of the company managers explained, in order to show to the contracting agency that the company has the manpower and the facilities available to do the job, company B hires 300 engineers and scientists, company C does likewise, and company D recruits 300 engineers and scientists to prove its capabilities to complete the project. Company E hires 300 engineers and, in addition, spends a million dollars on a new building to show its capabilities and interest in project "P".

In the end, only one of these four companies would be awarded the contract and the other three companies would not need the 300 engineers and scientists that each of them hired. When these four companies recruit these engineers and scientists, they do not inform the persons involved as to the possible temporary nature of the job. The individual describing this example stated that the solution for the 900 not-needed engineers and scientists is simple. He replied that the company receiving the contract would contact the personnel managers at the other three companies and would ask them to send their 900 recently

hired engineers and scientists to them. Practices such as this do cause short-term instability in engineering employment and result in serious dislocation problems for individuals and their families.

The origin of the above-mentioned practice, it was reported is in the fact that very often the Department of Defense requires that before a contract can be awarded, the company show that it has manpower and facilities already waiting to do the work. These requirements, in the opinion of some interviewees, are unreasonable, especially for large contract awards involving thousands of workers.

5. One of the reasons for the recent layoffs is the change in contracting policies of the Department of Defense--from cost-plus fixed fee contracts to cost-plus incentive type contracts. Whereas, under the old contracting policies, the company could earn at most 7 percent of the total sales, under the cost-plus incentive type contracts, the profits can go up to 14 percent of the net sales. Under the previous arrangements, therefore, it was beneficial for a company to have a large number of engineers work on a contract, because 7 percent of the larger payroll is better for the corporate earnings of the organization. Under the new system, the companies can earn higher profits if they do the work with the help of fewer but highly efficient engineers and scientists. This recent change in the contracting policies has forced defense companies to become more efficient and as a result many marginal and inefficient engineers and scientists were discharged.

6. Another important reason for engineering and scientific unemployment is the fact that technical talent is concentrated in a few geographical locations. Such locations are the Pacific Coast, the North East, and the South East regions. The problem arises because at any particular time either most of the companies in each of these regions are laying off engineers and scientists or they are doing intensive hiring simultaneously. Because of lack of diversification in these regions, there are no cushioning effects in the event defense cutbacks and/or shifts occur.

Observations on Manpower Policy

There are individuals who believe that layoffs are an essential part of the free enterprise system and that they can never be avoided. These individuals claim that business organizations cannot be efficiently run if management cannot resort to layoffs. The author agrees that there are times when because of poor business conditions layoffs are absolutely necessary. However, in the case of defense industries, layoffs have occurred during years of record profits for the companies involved. For example, in the case of one defense contractor, net earnings after taxes rose by more than 100 percent during the year the company had mass layoffs. Another defense employer had record earnings during the year it laid off large numbers of engineers and scientists.

An important feature of layoffs by defense firms is that they are periodic. Within six-months to a year after the previous layoff, defense companies usually have extensive

recruitment programs. For instance, the most recent layoffs affected 30,000 engineers and scientists. It appears that within a one-year period more than 90 percent of these laid off individuals were able to locate jobs. If it is assumed that approximately 50 percent of them found re-employment with defense employers, it meant a net loss of $35 million to the Department of Defense. The loss is computed by adding the severence pay, recruitment expenses, and relocation allowances--all of which come out of the overhead charged to the Department of Defense.

Recommendations to the Agencies of the Federal Government

1. The Bureau of Employment Security, in conjunction with State Departments of Employment and through its Labor Inventory Communications System (LINCS), has at its disposal a network which can improve the job-information process for engineers and scientists seeking employment.

This study has shown that 60 percent of the laid off engineers and scientists submitted work applications at various offices of the California State Department of Employment. However, only 3 percent of these individuals obtained re-employment by this method. The main difficulty is that employers do not normally list professional job vacancies with these departments.

It is recommended that:

(a) The Bureau of Employment Security publish regional lists of engineers and scientists who are looking for jobs. These lists should be issued at regular intervals, say bi-monthly, and mailed to major employers in the region. A brief

resume of the available engineers and scientists should be included in the list.

(b) The Department of Defense should require all contractors to list every job vacancy with the local State Departments of Employment.

(c) The Department of Defense should reduce the reimbursement to its contractors for job advertisements and for fees paid to private employment agencies. Such a step would encourage defense contractors to use the facilities of the Bureau of Employment Security.

2. This research has indicated that employers' hiring policies are discriminatory towards older engineers and scientists. If an individual is over 45 years of age, his technical capabilities--measured in terms of educational background, professional activities and orignal contributions--are completely ignored. As pointed out in a recent publication of the U. S. Department of Labor, "if employment age restrictions persist, artificial manpower shortages will be created and a manpower squeeze will result. Even more important, America will be deprived of an invaluable resource, the experience and production sense of older workers."[1]

In order to assist the older engineers and scientists, the Department of Labor should:

(a) Institute special job-placement services for older workers.

(b) Provide retraining and updating facilities with special emphasis on obtaining advanced degrees.

---

[1] U. S. Department of Labor, Ability is Ageless, Washington, D. C., U.S.G.P.O. (1960), p. 8.

3. The length of advance notices given to engineers and scientists were unreasonably short. Fourteen percent of the respondents did not receive any advance notice whatsoever of their forthcoming layoff; some of these respondents had worked for their company for five years or more. Fifty percent of the subjects received advance notice of 7.58 working days or less.

It is recommended that the Department of Labor sponsor national legislation establishing reasonable standards of advance notice based on an employee's length of service with the company.

4. As has been shown in this report, shifts from defense to commercial work are quite common among defense engineers and scientists. An average of one-third of the defense engineers who change jobs shift to commercial work.

Subsequent to their layoff, 54 percent of the defense engineers and scientists in the San Francisco Bay Area transferred to commercial work. These respondents made the shift apparently without any retraining. Evidence of large scale transference to commercial work was also noted by the Boston layoff study.[2]

The present study shows that respondents who received salary increases or no change in salaries at their commercial jobs had a longer tenure than those who received salary cuts. Furthermore, it was found that a higher proportion of respondents with lower pre-layoff salaries transferred to commercial

---

[2] Joseph D. Mooney, Displaced Engineers and Scientists: An Analysis of the Labor Market Adjustment of Professional Personnel, Ph.D. Thesis, Massachusetts Institute of Technology, p. 137 (June, 1965).

work. It appears that if salary structures for commercial jobs are raised, even a larger number of defense engineers would shift to commercial work.

Thus, in planning for the impacts of disarmament and defense cutbacks, transferability of engineering and scientific skills does not appear to be a problem. The mutual transference between defense and commercial work would become even more widespread, if the commercial industries were to offer opportunities as attractive as the defense industries. This would be possible only when extensive R & D programs are established in the commercial industries.

The Arms Control and Disarmament Agency should sponsor legislation which will encourage commercial R & D spending and would raise the level of engineering and scientific opportunities offered by commercial companies.

5. If it is true that the Department of Defense has, in the past, cancelled large contracts without giving a reasonably long advance notice to the companies, then the Federal Government itself is a party to creating mass unemployment among engineers and scientists.

It is recommended that, in order to help stabilize engineering and scientific employment, the Department of Defense take another look at its policy of short-notice cancellations and try to avoid such actions in the future.

Recommendations to Agencies of the State Government

1. This research has revealed that unemployment insurance is the most commonly used and the most important source of fi-

nancial assistance to unemployed engineers and scientists. However, this source does not provide adequate financial support.

It is suggested that the unemployment insurance benefits be increased to the extent that the individual can obtain approximately one-half of his pre-layoff salary.

2. As has been pointed out earlier, 21 percent of the laid off engineers and scientists left California. Furthermore, the respondents who left California were younger, had obtained higher levels of education, and had received their formal degree more recently.

It is estimated that, as a result of recent layoffs, 250 engineers and scientists left the State of California. This out-migration has meant a net business loss of approximately 10 million dollars to the State. This means that the State has lost all of the income tax on this sum. Moreover, because of multiplier effects, losses to real estate and other businesses have been enormous. A constructive action to counteract this out-flow of highly trained talent, therefore, is in the financial interest of the State of California.

The author urges that an Agency for the Conservation of Engineering and Scientific Resources (ACER) be established. This agency could either be a State financed semi-autonomous organization or it could be a non-profit organization funded by the State and private foundations.

As soon as a qualified engineer or scientist is laid off, he should be free to join the proposed agency and receive 50% of his pre-layoff salary for putting in a 40-hour work-week. The individual would be given every fourth week off to look for

a job. During the work-weeks, he would be engaged in solving problems such as smog control, mass transportation, waste management, etc., etc. Seventeen percent of his salary would be paid by the company from which he was laid off, another 17 percent by the Department of Defense, and the remaining 16 percent by the State.

The engineers and scientists would be permitted to work in the proposed agency until they obtain full-time jobs. Since the engineers and scientists would be receiving only one-half of their regular salaries, and because they would be free every fourth week for their job-search activities, this would encourage them to locate a job as soon as possible. It is estimated that the proposed agency would not cost the State of California more than $3 million per year. Furthermore, the State would not be paying unemployment insurance to these engineers and scientists who elected to join ACER.

In addition to conserving engineering and scientific resources, and being in the financial interests of the State, the proposed agency would have several advantages.

(a) Because the companies would be required to pay 17 percent of the engineers' salary as long as he remains unemployed, the management will be more careful in laying off such individuals.

(b) The employers in need of engineers and scientists would know where the available men are. The personnel managers of such companies could be invited to the proposed agency for the purpose of interviewing the available engineers and scientists.

(c) Many of the State's technical problems would be solved at less than one-sixth of the cost.

Recommendations to Defense-Oriented Companies

1. The out-placement services arranged by some employers were the fourth most efficient method by which laid off engineers and scientists located jobs. However, only 25 percent of the respondents were provided such services. This means that a large majority of the defense firms did not make any arrangements to help their employees locate other jobs.

It is recommended that in the event of future layoffs, defense firms should provide out-placement services. These services could be either in the form of inviting other prospective employers to the plant and arranging interviews with individuals scheduled to be laid off, or in the form of mailing brief resumes of the individuals involved to other companies.

2. The study has shown that the respondents were not given a reasonably long advance notice of their forthcoming layoffs. One-half of the individuals involved received advance notices of 7.58 working days or less; 14 percent did not receive any advance notice.

A reasonably long advance notice would ameliorate the hardships caused by massive layoffs and would facilitate the re-employment process. It is urged that engineers and scientists, who have worked for their employer six months or longer, be given at least a four-week advance notice of their involuntary terminations.

3. Severence pay was the second most important source of financial assistance for the unemployed engineers and scientists. However, severence pay coupled with unemployment insurance was not an adequate source of financial support. Even the respondents who remained unemployed for four weeks or less had to depend upon liquidation of their savings and investments.

Furthermore, only 54.6 percent of the subjects were given severence pay. During the personal interviews with engineers and scientists, it was pointed out that one large employer later unsuccessfully tried, by a suit, to get back the severence pay from the employees who were laid off.

In order to alleviate individual financial problems caused by layoffs, it is recommended that employers institute liberal severence pay policies.

4. The results of this research make it evident that the hiring policies of the employers are discriminatory towards older engineers and scientists. Apparently the employers disregard educational background and other technical capabilities of older individuals. Some of these older engineers and scientists are undoubtedly above-average individuals and could contribute a great deal to the activities of defense employers.

It is advocated that the firms not discriminate against older workers and utilize this reservoir of experienced well educated technical manpower.

5. Approximately 60 percent of the laid off engineers and scientists reported that their technical talents had not been utilized to the fullest extent. The more competent and the highly educated respondents reported relatively more under utilization. Such large scale under-utilization is not only a waste of highly trained manpower, it is not in the best interests of the firms involved. Under the cost-plus incentive type contracts, a reduction in under-utilization of technical talent would mean higher profits for the companies.

It is proposed that the defense firms institute appropriate programs for the purpose of avoiding under-utilization of technical manpower. An example of such a program would be to periodically request engineers and scientists to complete anonymous questionnaires designed to detect under-utilization and its causes. If it is determined that the firm's engineers and scientists feel under-utilized, then corrective steps based on the reported causes could be taken.

6. Some of the personnel managers and executives maintained that an excessive rate of growth on the part of some companies is another reason for engineering and scientific employment instability. It was pointed out that a growth of between 10 to 15 percent is a healthy one.

It is, therefore, recommended that the managements of defense companies plan reasonable growth rates compatible with long range stability of employment for its employees.

7. During the process of bidding for contracts, it appears that defense companies sometimes hire engineers and scientists on a temporary basis. However, the engineers and scientists involved are normally not told that, in the event the company is not awarded the contract, their jobs will be terminated. Furthermore, if the contract in question is a large one, numerous engineers and scientists are affected.

It was remarked by many interviewees that companies should be honest and frank with engineers and scientists. The individuals should be told in advance that the continuation of their jobs depends upon the award of a particular contract.

It was observed that if the engineers and scientists knew their jobs depended upon the acceptance of a particular company proposal, these individuals would put a special effort into preparing the proposal. Moreover, in the event the company is not awarded the contract, indviduals would not be faced with an emotional shock at an early termination.

It is recommended that in case of temporary appointments, defense companies should be candid with engineers and scientists and should inform them of the uncertain nature of the job.

8. The report has revealed that the four most commonly used methods by engineers and scientists for the purpose of locating jobs are:

(a) Direct applications to companies

(b) Newspaper advertisements

(c) Friends and personal contacts

(d) State Department of Employment

Of the four methods above, companies have used the State Departments of Employment the least. This study shows that 61 percent of the respondents visited various offices of the California State Department of Employment.

It is urged that the defense companies list all engineering and scientific vacancies with the State Departments of Employment.

Recommendations to Commercial Companies

1. From this study, it can be concluded that shifts from defense to commercial work are quite common among defense engineers and scientists. Apparently the engineers and scientists who transferred to commercial work have done so without any

prior retraining. It appears, therefore, that alleged shortcomings of defense engineers and scientists, such as inability to work in jobs requiring broad technical background, lack of cost consciousness, etc., are unfounded.

It is suggested that commercial companies not discriminate against defense engineers and scientists.

2. In analyzing the shifts from defense to commercial work, it was found that commercial companies hired respondents who are relatively less educated, read fewer technical magazines, and take fewer courses at their place of employment. This was because commercial firms were able to attract lower-salaried respondents only. Such a trend will in the long run hurt the efficiency, the growth rate, the innovativeness, and hence the competitiveness of commercial industries.

This trend could probably be reversed if commercial companies would offer more attractive salaries and more challenging work. One of the ways to create more challenging jobs in the commercial firms is to increase the commercial R & D spending. It is thus urged that commercial firms:

(a) raise the level of their engineering and scientific salary structures, and

(b) expand their R & D programs

3. Just as the defense firms have avoided hiring older engineers and scientists, commercial companies have done likewise. A large reservoir of the nation's technically trained and experienced manpower is consequently being wasted.

It is recommended that commercial firms not reject well educated, competent engineers and scientists simply because of old age.

Recommendations to Engineers and Scientists

1. One of the ways in which engineers and scientists can help stabilize the employment market is by using discretion in selecting their future employers. They should avoid firms which have had periodic mass layoffs. It was reported to the author by many interviewees that, as a result of the recent layoffs, many engineers and scientists are now accepting job offers not on the basis of salary alone. They are presently taking into account the growth pattern and the past record of employment stability of the firm. One of the national magazines commented on the situation as follows:

> Probably the one bright spot in this picture is that many engineers are examining these tantalizing offers carefully, and then rejecting them. There is not the mobility there once was. Too many engineers remember the layoffs of 24 months ago. Out on the West Coast, personnel managers complained that many eastern engineers won't even listen to their blandishments because of the reputation the industry out there has earned for severe ups and downs.[3]

It is urged that engineers and scientists, before accepting employment, examine the past record of the company in terms of employment stability.

2. The results of this study show that engineers and scientists who became victims of recent layoffs were given unreasonably short advance notice. One out of every seven of the respondents did not receive any advance notice. One-half of them received advance notice of 7.58 working days or less. Furthermore, 45 percent of the respondents did not receive any

[3] "Help Wanted Maybe," editorial, Electronics (March 1965), p.23.

severence pay.

In order to alleviate hardships caused by sudden and massive layoffs, engineers and scientists should ask for guarantee of a reasonably long advance notice (a minimum of four-weeks advance notice after six-months service) or four weeks severence pay in lieu of advance notice. Such requests could be made to the companies through engineering professional societies or by individual engineers and scientists at the time of their employment.

A few of the engineering societies have taken positive actions toward finding solutions to the problem of periodic engineering unemployment. For instance, the National Society of Professional Engineers has shown its concern for this problem. The State of California Chapter of this society arranged a two-day symposium entitled "Engineering Employment--Can We Meet the Challenge?" and came up with several recommendations. Engineers and scientists should support professional societies which look after their economic interests.

3. The three most important methods of job search, according to this report, are:

(a) Direct applications to companies

(b) Friends and personal contacts

(c) Newspaper advertisements

While looking for a job, engineers and scientists are urged to concentrate on the three above-mentioned methods.

Recommendations for Further Research

On the basis of experience gathered from conducting this study, the author would like to recommend that further research be conducted in the following areas.

1. Diversfication of defense industries has been suggested for a considerable number of years as one of the solutions for overcoming the effects of periodic defense cutbacks and shifts in defense spending. It has been proposed that all firms doing business with the Federal Government be required to keep their net defense sales below a certain designated percentage of their total sales. A figure of 50 percent defense and 50 percent commercial sales has been advocated by some observers.

According to a recent study of the impacts of defense cutbacks on electronics industries, conducted by the Battelle Memorial Institute of Columbus, Ohio, many diversification attempts among larger companies have been less than vigorous. Aggressive diversification efforts among some medium-sized companies ($2 million-$100 million net sales) have been highly successful over a three-to-five year period.[4]

The findings of the study show that as far as defense engineers and scientists are concerned, shifts from defense to commercial work have been quite common. Apparently, transferability of skill and experience of defense engineers and scientists is not an obstacle towards diversification of defense-oriented firms. During the interviews, it was pointed out to the author, that some of the defense companies do not wish to specialize in anything but defense work, because the chief executives of these companies are either mostly aircraft and missile designers or they are retired military officers, or both.

---

[4] Peck, Charles S., A Study of Implications of Reduced Defense Demand for the Electronics Industry, Battelle Memorial Institute, Columbus, Ohio (July 1965), p. 40.

It was indicated that these individuals are not capable of leading their companies successfully into commercial markets.

It is thus proposed that a study of the problems faced by executives of defense companies in shifting their firms successfully into commercial markets be conducted.

2. Under the sponsorship of the Department of Defense, the Department of Labor, and the Arms Control and Disarmament Agency, several studies dealing with defense-oriented layoffs have been conducted. However, as has been shown in this study, defense layoffs normally result in subsequent commercial layoffs.

It is urged that a study dealing with the unemployment and re-employment experiences of engineers and scientists laid off by non-defense companies be conducted. A comparison of such a study with the already completed defense layoff studies could lead to some very useful results.

Tentative Work Material for Occupational Home Economics Programs.

South Carolina State Dept. of Education, Columbia. Home Economics Education Section
Clemson Univ., S.C. Vocational Education Media Center
MF AVAILABLE IN VT-ERIC SET.
Pub Date - Sep67 90p.

*TEACHING GUIDES; *PROGRAM GUIDES; *OCCUPATIONAL HOME ECONOMICS; *SERVICE OCCUPATIONS; CHILD CARE WORKERS; FOOD SERVICE WORKERS; MAIDS; CLOTHING MAINTENANCE SPECIALISTS; POST SECONDARY EDUCATION; INTERIOR DECORATOR; ADULT VOCATIONAL EDUCATION; SECONDARY EDUCATION; RESOURCE MATERIALS; TEACHING TECHNIQUES

These materials are for teacher use in planning occupational home economics programs to prepare high school, post high school, and adult groups to be child care workers, homemakers' assistants, food service workers, clothing maintenance and interior design aides. They were developed during workshop at the South Carolina State College in July, 1967. Objectives are suggested for each program area. Generalizations, learning experiences, teaching materials, and evaluation techniques are listed in tabular form beneath each objective. Approximate time is suggested. The appendix includes: (1) purposes of instrumental programs in home economics, (2) differences in homemaking and occupational home economics, (3) using the community survey, (4) job analysis, (5) job related work experience, (6) observation - child care aides, (7) teachers - basic competencies, (8) follow-up of graduates, and (9) visual aid suggestions. FOREWORD

The programs for occupations related to home economics developed during the past three years have been most interesting and successful. The in-service workshops and conferences have provided opportunities for teachers to share ideas and to develop tentative work materials for classes. These tentative unit plans for several areas in occupations related to home economics were prepared by the teachers attending the occupational workshop at South Carolina State College, Orangeburg, South Carolina, in July, 1967.

We are very grateful to Mrs. Mattie P. Jackson, Head, Home Economics Teacher Education, State College, for serving as coordinator of the workshop; and, to Miss Joyce Terrass, Purdue University, Lafayette, Indiana and Mrs. Flora Conger, Coordinator of Child Development, Hoke-Smith Technical School, Atlanta, Georgia, for serving as consultants. Special appreciation is expressed to Mrs. Estoria Jones and Mrs. Georgia Elam, Home Economics teachers at the C. A. Johnson High School, Columbia, South Carolina, for serving as librarian, secretary, and leaders for special areas, and helping in the overall planning and securing of teaching materials. Miss Ella Wyman and Miss Edith Williams, District Supervisors of Home Economics Education, also assisted in the overall planning and the securing of teaching materials and helped in making the workshop successful. Special recognition is expressed to Mrs. Carriebelle Gregory, Home Economics teacher at the Matthew E. West High School, Hardeeville, South Carolina; Mrs. Ethel D. Malloy, Home Economics teacher, Eastside High School, Bennettsville, South Carolina; and, Mrs. Dorothy I. Way, Home Economics teacher at Orangeburg High School, Orangeburg, South Carolina. We are also grateful that other teachers of home economics occupational programs in different areas attended the workshop and shared ideas from their experience: Mrs. Helen C. Epting, Mrs. Myraline Hicks, Mrs. Katherine Stone, and Mrs. Mabel Thomson. Mrs. Mabel Johnston, District Supervisor, Home Economics Education, also attended the workshop for several days and to her we express gratitude.

Special appreciation is expressed to Miss Edna Page, Home Economist with the Vocational Education Media Center at Clemson University, Clemson, South Carolina, for editing the material and making copies available.

These materials are suggestive for the teachers in the local schools and, of course, will need to be adapted and changed to meet the local needs. It is hoped that each teacher will keep copies of her own plans and/or copies of changes made in these unit plans so that revisions can be made next summer.

Alma Bentley, State Supervisor
Home Economics Education
September, 1967

SUGGESTED PROGRAM FOR CHILD CARE WORKER

Introduction

The child care worker is prepared for service in several different establishments--day care centers, nursery schools, children's hospitals, children's homes, and individual family homes. Class experiences and on-the-job experiences are designed to help develop abilities and understanding needed when assuming the responsibility of caring for children.

The approximate number of hours given for each objective is only a suggestion. Requirements for class and work experiences will vary for high school, post high school, and adult groups. Class requirements will also be dependent upon the previous experiences of the class members and the level of child care service the students wish to enter.

Objectives

To develop awareness and understanding of characteristics and qualities of a good employee in child care service.

To develop awareness of various types of child care services and jobs within these services.

To understand young children and develop warm relationships with them.

To gain some understanding of children's behavior.

To help children develop good self-help habits.

To become aware of the importance of food to young children.

To develop awareness and understanding of the use and care of equipment and supplies.

To develop some concern and responsibility for children's safety.

OBJECTIVE: TO DEVELOP AWARENESS AND UNDERSTANDING OF CHARACTERISTICS AND QUALITIES OF A GOOD EMPLOYEE IN CHILD CARE SERVICE

Approximate time -- 2 weeks

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. A good employee 1. is clean and neat, 2. holds a current health card, 3. dresses appropriately, 4. speaks properly, 5. has a good attitude toward work, 6. is cooperative, 7. is punctual, 8. has a sense of responsibility.	A. 1. Discuss good grooming as an essential for employment.		Interest shown in being well-groomed and appropriately dressed at all times
	2. View and discuss the film, "The 90% of You," on body care and good grooming.	Film: "The 90% of You"	Film evaluation
	3. Discuss good health. Have a resource person from the Health Department to lead the discussion. Have each student secure a health card.	Resource person from Health Department	
	4. Demonstration by class members as to correct and incorrect grooming, posture, and dress on the job.		
	5. Discuss the effect one's attitude has on the quality of work and the ability to get along with fellow workers.		
	6. Make a list of positive attitudes toward work and a list of negative attitudes toward work. Discuss ways in which the negative attitudes could develop into positive attitudes.		Participation in discussion
B. Employee etiquette is an important part of a job.	B. 1. Have an employer in child care service come in and lead a discussion on the importance of employee etiquette.	Resource person	

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	2. Compile a list of employee etiquette rules to be observed at all times.	Prospective employers	
	3. List a group of don'ts while on the job.		
	4. Role play proper etiquette (a) in using the phone, (b) in addressing your employer, (c) in introducing visitors.		Evaluation of role playing situations
C. Knowledge of job policies facilitates better job performance.	C. 1. Discuss policies of child care centers in regard to (a) tardiness, (b) sick leave, (c) vacations.		
D. Establishing good working relationships is necessary for job happiness and success.	D. 1. Study materials on relationships.	Berry, Mary, Guide to Good Manners, Chicago, Science Research Associates Wrenn, Gilbert A., How to Increase Your Self Confidence, Chicago, Science Research Associates	
	2. Discuss types of relationships a child care aide may encounter, such as: (a) Director-employer (b) Employee-employer (c) Parent-employer (d) Parent-employee (e) Employer-child Role play some of these situations.		Evaluation of role playing

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	3. Interview several child care employers as to what they expect of their employees regarding relationships.		
	4. Child care employees tell how they maintain good working relationships with their co-workers.	Resource persons	
	5. Write a paper on the importance of harmonious relationships between employees.		Written work

OBJECTIVE: TO DEVELOP AWARENESS OF VARIOUS TYPES OF CHILD CARE SERVICES AND JOBS WITHIN THESE SERVICES

Approximate time -- 2 weeks

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Various types of jobs are available within the area of child care services.	A. 1. Show film, "Children of Change" and discuss needs for child care centers.	Film: "Children of Change"	Film evaluation
	2. Read Hammond-Dales, Good Schools for Young Children to show the different types of schools available to young children.	Hammond, Dales, Skipper & Witherspoon, Good Schools for Young Children	
	3. Conduct a survey to determine the kinds of child care services available in the area. Discuss purposes of each of the services. Identify ways in which they are alike and ways in which they are different. Prepare bulletin board on each of the kinds of child care services. Use with the discussion.		Evaluation of visual aids
	4. Show film: "Little World." Discuss a good day center using the ideas from the film.	Film: "Little World," Health Welfare Materials Center Child Welfare Journal, Child Welfare League of America, Inc. Vol. XLI, No. 1	
	5. Analyze the jobs available in child care services to see what competencies are needed for the job.		Job analysis

OBJECTIVE: TO UNDERSTAND YOUNG CHILDREN AND DEVELOP WARM RELATIONSHIPS WITH THEM

Approximate time -- 2 weeks

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Understanding one's self is the first step toward understanding children.	A. 1. Develop guides for one's own behavior with children. 2. Relate an early childhood experience which established a warm relationship with an adult. 3. Develop specific suggestions for guiding children, giving directions, and giving help when needed. 4. Practice giving directions in a positive way. Tape and listen to tone of voice. Practice to improve tone of voice.	Booklets: "Exposing Your Personality" "Self-Understanding-A First Step to Understanding Children"	Class participation
B. Persons who guide and care for children need to possess emotional maturity.	B. 1. Observe adults working with children--identify desirable characteristics they have.		Observation reports
	2. Show and discuss film, "Control Your Emotions."	Film: "Control Your Emotions"	Film evaluation
	3. Discuss goals that should be considered when guiding children.		
C. Qualities desirable in establishing a warm relationship with children are: 1. communication, 2. honesty,	C. 1. Role play each quality needed by child care aide to help establish a warm relationship with children.	Hurlock, Child Development, Chapter 10.	
	2. Make posters and prepare bulletin boards on "Desirable Qualities of the Child Care Aides."	Posters and bulletin boards	Evaluation of visual aids

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
3. fairness, 4. understanding.	3. Tape an interview with a nursery school supervisor or director on desirable qualities of a child care worker. Use tape for class discussion. 4. Role play situations when poor communication techniques are used with children. 5. Compile a list of desirable techniques in communicating with children.	Taped interview	
	6. Write a paper: "The Kind of People Little Folk Love."		Written assignment

OBJECTIVE: TO GAIN SOME UNDERSTANDING OF CHILDREN'S BEHAVIOR

Approximate time -- 6-8 weeks

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. There are a number of factors which influence children's behavior.	A. 1. Discuss children's behavior in general, using agree and disagree statements to begin the discussion and keep it in progress.	Agree and disagree statements	Observe students during discussion for knowledge and understanding of children.
	2. Show film, "He Acts His Age." After film have students list the behavior levels of different age groups.	Film: "He Acts His Age"	Show film once. Before second showing give students questions for looking for specific information.
	3. Discuss factors of heredity and environment that cause children to display different behavior.	Hurlock, Elizabeth, The Developing Child	
	4. Have students explain the statement: We are the sum total of our experiences."		
B. A child's feelings are expressed through his actions.	B. 1. Describe different ways that children express anger, fear, love, and hate.	Hurlock, Elizabeth, The Developing Child	
	2. Discuss the statement: "A child acts the way he feels." Give examples to illustrate the statement.		
C. Each child is is an individual; it is necessary to	C. 1. Show films: (a) "Individual Differences" (b) "Meeting Emotional Differences in Children"	Films: "Individual Differences" "Meeting Emotional Differences in Children," S. C.	Evaluation of film discussion

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
meet and understand individual differences.	Discuss the differences seen in (a) emotional development, (b) intellectual development, (c) physical development, (d) social development.	Mental Health Assoc., Columbia, S. C.	
	2. Role play different ways to meet and handle behavior problems.		
D. Observation is a valuable technique in learning about children.	D. 1. Have a panel discussion on the value of observation. Include a mother, nurse, doctor, and nursery school or kindergarten teacher on the panel.	Panel members "Observation: A Valuable Tool," Forecast, May, 1960	Discuss what was learned from the panel discussion.
	2. Discuss and role play the proper techniques used to observe children.	Read, Katherine, The Nursery School	
	3. Set up some guidelines for observing children.		
	4. Develop observation sheets for class to use in observing.	Evaluation sheets	
	5. Have students practice techniques of observation.	Observations	Application

OBJECTIVE: TO HELP CHILDREN DEVELOP GOOD SELF-HELP HABITS

Approximate time -- 2 weeks

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Proper equipment is needed to develop self-help habits and routines.	A. 1. List some self-help habits desirable for children to form.	Read, K., The Nursery School	Individual assignment
	2. Discuss the relationship of good food, clothing, and toilet habits to the use of proper equipment.	Langlord, Louise M., Guidance of the Young Child, John Wiley & Sons, Inc., New York	Class participation
	3. Study the storage areas in the child care center. Discuss how the proper arrangement of room and equipment can encourage children to put away their toys, clothing, etc.		Written reports
	4. Observe children in a nursery school or kindergarten and note their toilet, sleep, and mealtime habits and routines.		Observation reports
B. Establishing routines helps to develop self-reliance and independence.	B. 1. Make a list of the various ways children can be taught to put away toys and equipment when they have been used.	Hurlock, Elizabeth, Child Growth and Development, McGraw-Hill Book Co., N. Y.	
	2. Explain how self-help features in clothing can be a tool in developing self-reliance.		
	3. List finger foods that would be easy for children to eat.		
	4. View and discuss film, "Mealtime Can Be a Happy Time."	Film: "Mealtime Can Be a Happy Time"	Film evaluation

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	5. Plan ways to help children do things for themselves.		

OBJECTIVE: TO BECOME AWARE OF THE IMPORTANCE OF FOOD TO YOUNG CHILDREN

Approximate time -- 2-3 weeks

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Good nutrition is important for the growth and development of the child.	A. 1. Divide class into groups for reports: (a) Nutritional needs of growing children (b) How food affects growth, development, and behavior of children (c) Preparing essential disliked foods so children will like them (d) Importance of a schedule and how schedules promote good eating practices (e) Special holiday meals (f) Introducing new foods to children (g) Planning a balanced diet for children (h) Color texture and flavor combinations in children's food Discuss thoroughly each topic after the report.		Class reports
	2. Plan one day's meals and two snacks for a pre-school child. Place on board and analyze for nutritive values using food nutrient chart and basic four chart.	Food nutrient chart Basic four chart	Menus
	3. Cook and serve meals suitable for young children. Be aware of high seasoning and amounts to serve. Invite a group of children in and serve them.		Evaluation of preparation and serving of meals

OBJECTIVE: TO DEVELOP AWARENESS AND UNDERSTANDING OF THE USE AND CARE OF EQUIPMENT AND SUPPLIES

Approximate time -- 2 weeks

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. The choice, use, and care of equipment and supplies for children demands much attention. Equipment and supplies are important elements in the child's development and growth.	A. 1. Show film, "A Good Day in Kindergarten." Look for the various types of equipment and supplies used in the film.	Film: "A Good Day in Kindergarten," Helen Hefferman, narrator	
	2. Visit a child care center and observe and record names and use of equipment and supplies.	Field trip	
	3. Compare equipment in center with that in film and discuss.		
	4. Read selected references on equipment for child center. Compare criteria with that of State Department. Set up a criteria for your class to use.	Hammond, Dales, Skipper, Witherspoon, Good Schools for Young Children	Quiz on correct names for equipment and supplies
	5. Show films, "Starting Nursery School," and "A Pre-Kindergarten Program in New Haven." Discuss (a) what equipment and supplies were lacking, and (b) what equipment and supplies were on hand.	Films: "Starting Nursery School" "A Pre-Kindergarten Program in New Haven"	
	6. Compare improvised equipment with commercial equipment.		
	7. Practice using the supplies and equipment commonly seen in child care centers.	Supplies in laboratory	Check list indicating level of performance
	8. Discuss the basic needs of children that are met with each piece of equipment.		

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	9. Practice storing and cleaning equipment and supplies	Storage center Cleaning supplies	Self-evaluation
	10. Using supply and equipment catalogues, set up the equipment and supplies for an imaginary specified child care center.		Evaluation of equipment and supply plans

OBJECTIVE: TO DEVELOP SOME CONCERN AND RESPONSIBILITY FOR CHILDREN'S SAFETY

Time -- 1 week

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Many accidents among children can be prevented by eliminating hazards to the child's safety.	A. 1. Make a bulletin board display of magazine and newspaper clippings which relate children's accidents. Discuss these accidents. Add to discussion personal childhood experiences of class members.	Magazine and newspaper clippings	
	2. Observe a child or group of children in school or on a playground. Note the safety hazards you find in the child's surroundings.		Observation reports
	3. Make a list of the most common safety hazards found in a child's surroundings. Point out ways to eliminate these hazards.		
	4. Show filmstrip, "Safety at Home on the Playground." Make a list of safety rules for children on the playground using the ideas brought out in the film.	Filmstrip: "Safety at Home on the Playground"	Filmstrip evaluation
B. Good play materials do not present hazards to the child's safety.	B. 1. Make a display of children's toys. Discuss each toy pointing out the safe features and the hazardous features.	Toys	Test: Identifying safe and hazardous toys
	2. Demonstrate the proper use of certain play tools, such as saws, scissors, etc.		
	3. Study children's equipment used on the inside and outside. Discuss the safe		Evaluation of safety of pieces of equipment

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	and unsafe features of common equipment used with children.		
C. Knowledge of first aid is necessary for emergencies.	C. 1. List accidents which may occur during a child's day. Have student demonstrations on first aid techniques.	Student demonstrations	Evaluation of demonstrations
	2. Have a nurse to talk on childhood accidents and procedures to follow when they occur.	Resource person	

SUGGESTED PROGRAM FOR HOMEMAKER'S ASSISTANT

Introduction

The homemaker's assistant carries on various responsibilities required for maintaining family life in a pleasant, orderly environment. A person trained as a homemaker's assistant may be employed either in the home or an institution (hospital, nursing home, child care center); under the direction of a homemaker if employed in the home, or a housekeeping supervisor if employed in an institution. Employment may be on a full time or part time basis.

The length of the class will vary according to the ability of the students and members in the class. A work experience of 40-50 hours is recommended.

Objectives

To develop some understanding of the nature of the job and its responsibilities.

To develop some ability in establishing good relationships with people.

To develop some ability in understanding and caring for children when the mother is away from home.

To develop some skill in cleaning all rooms in the house using suitable manual and electric equipment and appropriate cleaning materials.

To develop increased ability to plan, purchase, prepare, and serve simple nutritious meals.

To keep simple records of costs for foods and maintenance of the home.

To develop some ability in caring for the sick in the house.

To develop some understanding of how to prevent hazards that may cause accidents in the home.

To develop increased ability in handling emergencies and meeting people outside the home.

OBJECTIVE: TO DEVELOP SOME UNDERSTANDING OF THE NATURE OF THE JOB AND ITS RESPONSIBILITIES

Approximate time -- 4 hours

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. The homemaker's assistant is able to perform basic homemaking activities.	A. 1. Discuss the responsibilities of the homemaker's assistant: (a) Kinds of work homemakers in the community expect of a full-time or a part-time homemaker's assistant.	List of the responsibilities of the homemaker's assistant	Observation of the participation and interest of the group
	(b) Practices in the community concerning workers in the home.	A report of a study	
	(c) How the homemaker's assistant makes important contributions to family life.	1960 Handbook on Women Workers, U. S. Dept. of Labor, Women's Bureau, Bulletin 275	
B. Training improves skills which increase the worker's employability and wages.	B. 1. Discuss training as a factor for job success: (a) Training develops skills for jobs. (b) The importance of training for the job. (c) Skilled workers get the better jobs. (d) Skilled workers can expect higher pay. (e) Work agreements - working hours and hourly wages. (f) Mutual agreements of employer-employee before employment. (g) Agreement concerning the nature of work of the employee.	"How to Get That Part-Time Job"	
	2. Discuss the importance of understanding one's self.		

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	3. Use a check sheet to get a rating of yourself as an employee.	"How to Get That Part-Time Job," a chart for young adults - rate yourself, p. 13.	Use check sheet
C. Respect for other people builds a better concept of self by gaining respect from other individuals and groups.	C. 1. Discuss the ways in which we develop self-respect: (a) Manners (b) Morals (c) Cleanliness (d) Truthfulness (e) Cheerfulness (f) Conduct in public places (g) Promptness (h) Honesty (i) Consideration of others (j) Ability to communicate with others (k) Cooperative attitude (l) Acceptable behavior on the job	Berry, Mary. "A Guide to Good Manners," Science Research Assoc., 1951 Berry, Mary. Manners Made Easy, McGraw-Hill Company, N. Y., 1957 Peterson, Eleanor M. Successful Living, Allyn & Bacon, Inc., 1961 Carson, Byrta. How to Look and Dress, McGraw-Hill Company, N. Y., 1960	Dramatize meeting a homemaker for the first time. List ways to improve personal qualities.
	2. Role play desirable and undesirable personal qualities.		
D. Health includes the physical, mental, and emotional aspects of being able to face and solve problems of success or failure and adjust to new or unfamiliar situations.	D. 1. A talk by a physician or nurse on: (a) The importance of good health. (b) The importance of good health for the protection of the worker and family members. (c) Health examination as a protection for the worker, his family, and the employer. (d) Mental and emotional health.	A physician or a registered nurse	
	2. Write a paper on, "Why My Good Health is Important."		Individual papers on health

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
E. Social Security and labor laws influence one's job and wages.	E. 1. A talk by a person from the Social Security Office. (a) Social Security and labor laws (b) Social Security - an employee benefit (c) Social Security deductions (d) Social Security at retirement	A person from the Social Security Office	Participation in the discussion after the talk

OBJECTIVE: TO DEVELOP SOME ABILITY IN UNDERSTANDING AND CARING FOR CHILDREN WHEN THE MOTHER IS AWAY FROM HOME

Approximate time -- 20 hours

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. No two children are alike in their general development even if they are the same size and the same age, but all children have the same basic needs.	A. Discussion: Understanding children 1. Individual differences (a) habits (b) attitudes (c) skills (d) experiences		
	2. Show and discuss filmstrip: "Special Day Time Problem."	Filmstrip: "Special Day Time Problem," McGraw-Hill Book Company	Filmstrip evaluatio
	3. Basic needs of children: (a) adequate amount of nutritious food (b) wholesome exercise for growth and development (c) proper rest and sleep (d) love and affection (e) a feeling of being wanted (f) a chance to explore new things (g) opportunity to be creative	Harriet and Shaw. Health Education	Quiz: What do you know about children?
B. The child is a developing human being. What he sees, hears, and feels affects his total development.	B. 1. Discuss helpful hints when caring for children: (a) Play, laugh and talk with the child at his level of experience. (b) Speak in a quiet tone of voice. (c) Expect obedience without nagging or making threats. (d) Be consistent in requests.		Observe children in a nursery school or kindergarten.

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	(e) Do not use fear as a means of control. (f) Respect the child as a person. (g) Keep an affectionate, pleasant attitude in dealing with children. (h) Encourage the child to do things for himself as far as possible. (i) Keep a record of perplexing situations and discuss with parents.		
	2. Develop a check sheet of do's and don't's when caring for children.	Check sheet of do's and don't's when caring for children.	Check results of check sheet
	3. Show and discuss filmstrip, "Keeping Children Happy."	Filmstrip: "Keeping Children Happy," McGraw-Hill Book Company	Evaluation of filmstrip
	4. Select a problem and role play solving that problem with a 2-year-old, a 4-year-old, and a 6-year-old child.		
	5. Observation and participation in a kindergarten or nursery school.		Performance on the job and observation reports
C. Household cleaning materials, medicines, and sharp-edged objects should be stored out of the reach of children.	C. Precautions when caring for children 1. Discuss and demonstrate: (a) storing household cleaning materials (b) storing medicine supplies (c) storing sharp-edged and other unsafe objects		
	2. Discuss and demonstrate: Keeping children safe from harm (a) in the home, (b) outside the home,		Objective test on child safety

[illegible]	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	(c) at the playground, (d) in the park.		
	3. Discuss safe and unsafe toys.	Display of children's toys, safe and unsafe	Participation in discussion
	4. Discuss observation of children's play activities, emphasizing the safe or unsafe features of play materials and equipment.		Observation reports

OBJECTIVE: TO DEVELOP SOME SKILL IN CLEANING ALL ROOMS IN THE HOUSE USING SUITABLE MANUAL AND ELECTRIC EQUIPMENT AND APPROPRIATE CLEANING MATERIALS

Approximate time -- 120 hours

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Some cleaning jobs need to be done daily, others weekly, monthly, or once in a while.	A. Discussions and demonstrations: 1. Sequence of daily cleaning jobs.		
	2. Sequence of weekly cleaning jobs: (a) Kitchen (b) Bedrooms (c) Bath (d) Living areas (e) Floors	Johnson Wax, "How to Make Housecleaning Easy," Education Department, Racine, Wisconsin Valentine, Bertha. A Guide to Cleaning House, Philadelphia Friends, Neighborhood House, 1962	Develop a chart for daily, weekly, and occasional cleaning jobs.
	3. Occasional cleaning: (a) Windows (b) Doors (c) Floors		
B. Adequate cleaning equipment and sufficient materials of the correct type are necessary when cleaning the house.	B. 1. Discuss and show equipment and materials needed for cleaning: (a) Clean dust cloths (b) Broom (c) Dust mop (d) Wet mop (e) Vacuum cleaner (f) Pail for water - cleaning agents	Craig, Hazel. Thresholds to Adult Living Cleaning equipment and materials	
	2. Trainees identify equipment for difficult jobs and study equipment needed for each.		Identification of equipment
	3. Discuss and demonstrate how to care for cleaning equipment.		
	4. Exhibit and discuss different types of soaps.	Soaps and detergents	

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	5. Exhibit and discuss different types of detergents used for cleaning.		
C. The actual cleaning of furniture, fixtures, and surfaces in the different areas of the home develops a concept of each cleaning job.	C. 1. Discuss the procedures and methods of cleaning.		
	2. Clean living area in the home economics department. (a) Assemble equipment and cleaning materials. (b) Dispose of all trash. (c) Dust walls with a vacuum brush or a clean cloth over a broom. (d) Dust pictures, tops of windows. (e) Dust drapes, upholstered furniture, lamps, books, window sills, and venetian blinds. (f) Vacuum rugs or carpet and clean uncarpeted floor with dust mop or vacuum brush. (g) Remove finger marks from doors. (h) Remove spots from upholstered furniture or rugs. (i) Dust and polish wood part of furniture.	Moore, Alma C. How to Clean Everything, New York: Simon and Schuster, 1952. Department of Community Colleges, State Board of Education, Raleigh, North Carolina, "A Guide to Housekeeping" "Remove Stains from Fabrics," C-62, Washington, D. C., U. S. Government Printing Office, 1961	Performance test
	3. Discuss and demonstrate cleaning the bedroom. (a) Air bedding, mattress, and pillows. (b) Clean springs with vacuum cleaner. (c) Turn mattress. (d) Make bed with fresh linen. (e) Clean mirror. (f) Clean closet: Hang everything in place and dust shelves and floor.		Competencies developed

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	(g) Clean walls, floor, and furniture same as living area.		
D. The kitchen is the heart of the house where food is prepared and served--keep the kitchen clean and attractive.	D. 1. Discuss daily cleaning of the kitchen. (a) Wipe all surfaces with a clean, damp, soft cloth or sponge. Use warm, soapy water. (b) Use ordinary soap and water on stainless steel surfaces; dry thoroughly after washing. (c) Remove accumulated grease from all surfaces with a mild abrasive cleaner. (d) Wipe up immediately foods spilled on vinyl plastic floor covering. (e) Dust tables, chairs, and other accessories. (f) Check refrigerator--wipe inside and outside surface where food may be spilled. (g) Wipe range. (h) Clean the sink. (i) Remove trash and garbage. (j) Clean floor as needed; sweep, mop, or vacuum.	Starr, Mary C. Management for Living, D. C. Heath & Company, 1963 Valentine, Bertha L. A Guide to Cleaning the House, 1962 Moore, Alma C. How to Clean Everything, Simon and Schuster, 1952.	Develop and use an evaluation check list for daily, weekly, and occasional cleaning jobs.
	2. Discuss weekly cleaning of the kitchen. (a) Defrost refrigerator and clean. (b) Mop and wax floor. (c) Dust woodwork and wipe all fingerprints from doors and woodwork. (d) Clean venetian blinds. (e) Clean mops, dust cloths, pails, and stove properly.		Competencies developed on the job.

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	3. Make a work schedule and clean the kitchens in the department, or find a homemaker who will cooperate in allowing you to demonstrate correct procedures for cleaning the kitchen in her home.	A selected home and a cooperative homemaker	Evaluation of cleaning
E. Good supplies and equipment make dishwashing easier and more sanitary.	E. 1. List and discuss the things that would be of chief help in making dishwashing easier: (a) Plenty of hot soft water. (b) A good soap or a good cleaning agent: (1) granulated soap (2) synthetic soap (3) a detergent (c) A sturdy scraper, as a rubber spatula. (d) Loose-mesh dishcloth, a sponge, or a dish mop or a round brush. (e) A single or double bowl sink. (f) Draining racks. (g) Dish towels. (h) A dish washer.	Starr, Mary C. Management for Better Living, D. C. Heath and Company, 1963, p. 161	Competencies developed
	2. Demonstrate washing dishes correctly by hand and by dishwasher.	Barclay, Marion and Champion, Frances. Teen Guide to Homemaking, McGraw-Hill Book Company, 1961	Performance on the job
	3. Demonstrate and discuss: (a) Storing china, glassware, silverware, linen. (b) Small equipment. (c) Large equipment.	China, silverware, glassware, linen, small equipment, large equipment	
F. A clean bathroom has a pleasant odor and it is	F. 1. Discuss steps in cleaning the bathroom: (a) Remove rugs and soiled towels. (b) Clean and disinfect toilet seat,	Mimeograph sheets with steps or directions for cleaning a bathroom.	Observation of interest that trainees have in

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
free from dirt and finger-prints.	basin, and tub; use brush or small mop only for this purpose. (c) Wash all equipment carefully inside and out. (d) Put disinfectant in the stool and let stand for awhile. (e) Clean mirror and light fixtures. (f) Dust wood work. (g) Clean walls and window sills with a damp cloth. (h) Polish faucets. (i) Put out clean towels. (j) Mop floor and rinse thoroughly. (k) Flush toilet to wash down disinfectant. (l) Clean windows and venetian blinds if needed.	"A Suggested Training Program," The Homemaker's Assistant, U. S. Department of Health, Education, and Welfare, Office of Education	developing skills in cleaning jobs.
	2. Each trainee thoroughly cleans a bathroom following directions in a selected house.		Report from cooperating homemaker

SUGGESTED PROGRAM FOR CLOTHING MAINTENANCE AIDE

Introduction

This course is designed for high school students who have an interest in occupational training in the field of clothing maintenance. Foundation courses in basic home economics and advanced home economics or basic preparatory home economics are recommended as pre-requisites to this course for high school pupils whenever this is possible. In some schools only basic home economics or basic preparatory home economics may be required as pre-requisites. This course may be offered without pre-requisites to pupils who have specified occupational objectives in this field.

Occupations in clothing maintenance range from simple repetitive tasks to those requiring both technical and scientific knowledge. The objective of the educational program at the high school level is centered around developing personal competencies for entry into the labor market in jobs requiring less than technical knowledge.

Objectives

To understand the causes of fitting problems and be able to correct them.

To develop skills in repairing clothing.

To develop some skills in clothing maintenance.

To understand desirable personal qualities for job success.

To become familiar with the factors which affect individuals in the world of work.

OBJECTIVE: TO UNDERSTAND THE CAUSES OF FITTING PROBLEMS AND BE ABLE TO CORRECT THEM

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Identification of fitting problems is the first step toward a comfortable and attractive dress.	A. 1. Try various types of ill-fitted garments on standard dress forms. Have students identify the fitting problems.	Dress forms and garments	Check list of characteristics of a well-fitted garment
	2. Show and discuss the filmstrip, "Fashion Fit." Emphasize the relationship between fashion and fit.	Filmstrip: "Fashion Fit," McCall's Corp., Dept. SS, Dayton 1, Ohio	
B. Fitting problems are corrected by identifying their causes and changing the garment accordingly.	B. 1. Have students try on basic shells. Identify fitting problems and discuss the causes of these problems. Use transparencies to point out other problems and their causes.	Allen, H. Unit Method of Clothing Construction, Iowa State University Press, Ames, Iowa Transparencies	
	2. Demonstrate the construction techniques for correcting common fitting problems: (a) irregular waist length, (b) irregular bust size, (c) low or high bust, (d) shoulders - round, broad, square, (e) gapping neck line, (f) irregular arm size, (g) irregular hip size.	Bishop, E. The Bishop Method of Clothing Construction, J. B. Lippincott Company, New York	
	3. Have students correct fitting problems through alteration of a personal garment.		Finished product

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	4. Demonstrate the alteration techniques commonly needed on children's clothing: (a) lengthening shoulders, bodices, and skirts, (b) lengthening boys' pants and sleeves, (c) shortening a slip.		
	5. Have students alter a child's garment.		Finished product
	6. Demonstrate alteration techniques commonly needed on men's clothing: (a) cutting trousers, (b) adjusting waistline, (c) adjusting sleeve length, (d) adjusting coat length.		
	7. Have students practice the common alterations for men's clothing.		Finished product

OBJECTIVE: TO DEVELOP SKILLS IN REPAIRING CLOTHING

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. The life of garments can be extended through skills in repairing clothing.	A. 1. Students will give class demonstration on one of the following mending problems: (a) broken zippers, (b) ripped seams, (c) replacing hooks and eyes, (d) repairing belt loops, (e) replacing lining, (f) sewing on buttons.	Demonstrations "Mending," Coop. Ext. Service, Iowa State University, Ames, Iowa, H. D. 24	Observation with check sheet for demonstration
	Each student will prepare a step-by-step guide to distribute to the class. Individual help will be given to student before demonstration is given.	Written guide	
	2. Assign altering problems to students in order to develop skills.	"Mending Men's Suits," U.S.D.A. Home and Garden Bulletin, No. 39.	Job performance
	3. Discuss and evaluate garments altered, including appearance, and amount of time required for making alterations.	"Mending Clothes and Household Fabrics," N. Y. State College of Home Economics, Cornell Ext. Bulletin 871	

OBJECTIVE: TO DEVELOP SKILLS IN CLOTHING MAINTENANCE

GENERALIZATIONS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Proper clothing maintenance extends clothing life.	A. 1. Discuss, using transparencies, the kinds of storage found in dry cleaning establishments and department stores: closets, shelves, drawers, hanging, cold storage. Continue discussion by identifying the types of clothing most suitably stored in each place and why.	Transparencies	
	2. Arrange field trips to a department store and a dry cleaning establishment to study their methods of storage.	Field trips	Written evaluation of field trip
	3. Display stained fabrics to enable students to recognize common stains. Discuss significance of removing stains before laundry so stain will not be set permanently.	Display of fabrics "Removing Stains from Fabrics," U.S.D.A. Home and Garden Bulletin No. 62.	
	4. Have person from dry cleaners and/or person from coin operated dry cleaner to demonstrate how spots are removed - materials and procedures used.	Resource Person Home Laundry Association, "End Spots and Stains"	Objective test
	5. Practice removal of common stains.	Cleaning agents, charts, bulletins	
	6. Demonstrate some procedures in pressing. Students will practice using press cloths, mits, steam and dry irons, and other pressing equipment. Have students evaluate appearance, time, and motion in pressing garments.	Nicholas, Florence W. and McDermott, Irene E. Homemaking for Teenagers, Bk. II, Chas. A. Bennett Co., Inc., Peoria, Illinois	Checklist on ironing skills Evaluation of practice session

SUGGESTED PROGRAM FOR FOOD SERVICE WORKERS

Introduction

Food service workers need to be prepared for employment in different types of businesses. Some of the jobs available in the area of food service are waiter or waitress, pantry worker, cook's helper, and lunch counter service worker. Places of employment vary from hotels and restaurants to hospitals and individual homes.

The content of the class will vary according to the students' abilities and the jobs for which the students are training. The program can be adapted to high school students, post-high school students, or adults. The length of the class will depend upon the number in the class and previous experience. In addition to classroom training, at least 40 hours of work experience is recommended as a minimum requirement.

Suggested Objectives

To become acquainted with different types of food service establishments, their organizational structure and functions.

To develop personal qualities needed for job success.

To develop some understanding of health and sanitary practices in food service occupations.

To develop some understanding of the safe use and care of different types of equipment.

To develop fundamental knowledge and skills needed to be a waitress.

To develop fundamental skills and knowledge in quantity food preparation and service.

To develop some appreciation of appearance, flavor, and nutritional value of food.

To develop some ability to adapt knowledge and skills to different types of businesses employing food service workers.

OBJECTIVE: TO BECOME ACQUAINTED WITH DIFFERENT TYPES OF FOOD SERVICE ESTABLISHMENTS, THEIR ORGANIZATIONAL STRUCTURE AND FUNCTIONS

Approximate time -- 2 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Careers in food service*	A. 1. Show and discuss film, "New Horizons in Food Service Careers."	Film: "New Horizons in Food Service Careers," H. J. Heinz Company	Class participation
	2. Discuss various careers in food service and give advantages and disadvantages of each.		
	3. Invite representatives from a variety of food service organizations and establishments to speak to class about their work.	Resource persons	
	4. Students make trips to various institutions for observation of people on the job in food service careers. Report to class and discuss observations.	Field trips	Field trip evaluation
B. Employment opportunities - jobs available	B. Make survey to determine what need the area has for food service workers. (a) Interview managers of food service institutions. (b) Use want-ad section of newspaper. (c) Consult employment agencies.	Field trips Survey blanks Food service managers Newspapers Employment agencies	Brief summary telling why you chose this area as an opportunity for a career.
C. Employment benefits (a) Insurance (hospitalization and compensation) (b) Social security	C. 1. Discuss employment benefits. (a) Invite an insurance representative to discuss the various types of insurance. (b) Have a resource person from the Social Security Office to discuss social security and retirement. (c) Compute a wage-earning scale.	Resource person from (1) Insurance company (2) Social Security Office Various forms - wage earning, annual leave, etc.	Application test - filling out various forms correctly.

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
(c) Retirement (d) Annual leave (e) Salary (f) Hours of work (g) Sick leave	(d) Discuss labor laws and how they affect the worker. 2. Secure forms and apply for social security cards.		
D. Kinds of work and work situation	D. Make a job-analysis of the different food service jobs available. Compare and contrast (a) Qualifications (b) Employment benefits (c) Responsibilities (d) People serviced	"Supervised Food Service Worker": U. S. Department of Health, Education, and Welfare West, Wood, and Harger. Food Service in Institutions, John Wiley & Sons, Inc. Food Service Industry, U. S. Department of Health, Education, and Welfare Job analysis for various jobs	Job analysis

*Desirable as pre-requisite and/or for background information.

OBJECTIVE: TO DEVELOP PERSONAL QUALITIES NEEDED FOR JOB SUCCESS

Time -- 2 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Personal grooming	A. 1. Observe and analyze the grooming of employees in food service.		Evaluation of observations
	2. Show filmstrip, "You and Your Appearance." (a) Make a list of characteristics expressed in the filmstrip which are important to job success. (b) Study improvements you might need to make.	Filmstrip: "You and Your Appearance"	
	3. Show filmstrip, "Through the Looking Glass to Grooming." Relate the ideas of the film to the grooming of food service employees.	Filmstrip: "Through the Looking Glass to Grooming," Proctor and Gamble Co. (Accompanied by booklet to give to members of class.)	Filmstrip evaluation
	4. Discuss the grooming techniques that help one to look attractive. Prepare a list of grooming techniques and select from the list those techniques which are most important to food service workers.	Booklet: "Through the Looking Glass - A Girl's Guide to Good Grooming," Proctor and Gamble Co.	
	5. Have a resource person from a food service occupation talk on personal cleanliness as related to food service.	Resource person	
	6. Develop a personal grooming check list and make a check on your own personal grooming.		Personal grooming check list

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	7. Appropriate dress (a) Visit stores that sell uniforms to: (1) observe the different styles and types, (2) compare construction techniques, (3) compare laundering qualities. (b) Discuss the factors that lend to the comfort of a uniform. (c) Discuss factors that would influence selection for specific uniforms. (d) Collect pictures depicting appropriate dress for the job in food service. (e) Demonstrate proper care and handling of uniforms for durability.	Field trip Magazines	Objective test Class participation
B. Personal relations on the job	B. 1. List and discuss various qualities which are desirable in getting along with customers, fellow workers, and employer, such as: courtesy, tolerance, consideration, manners, sense of humor, good attitude toward work, punctuality, dependability, and able to follow directions.	Booklets: "Exploring Your Personality," "Your Personality and You"	
	2. Panel discussion: "What is Expected of a Food Service Employee." Panel consists of teachers, two members of class, and two food service employers.	Booklet: "What Employers Want"	Written summary of what employers expect
	3. Make a list of things the trainees think they are supposed to do and compare with list of things employer may expect.	Booklets: "What Employees Want," "Employer-Employee Relationship"	

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	4. List qualities to help keep a job; also ways to lose a job.	Booklet: "How to Get and Hold the Job"	
	5. Analyze yourself to discover the personal qualities you possess which will be an asset to you as an employee and those which are liabilities and need to be improved.		Analyzing of self
	6. Dramatize a conflict in a work situation that might develop on a job. Then role-play a way of avoiding the development of the situation.		Observation

OBJECTIVE: TO DEVELOP SOME UNDERSTANDING OF HEALTH AND SANITARY PRACTICES IN FOOD SERVICE OCCUPATIONS

Approximate time -- 1 week

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Safe handling of food	A. 1. Discuss state and local food service regulations. Have resource person from Health Department to lead discussion.	"Rules and Regulations Governing Food Service Establishments," South Carolina State Board of Health, Columbia, S.C. Representative from Health Department	Pretest on knowledge of health practices
	2. Discuss the importance of having a health card. Have students secure health cards.		
	3. Discuss and develop safety rules for food service workers.	Pamphlets: "Here's How," Health Department	Oral discussion
	4. Demonstrate and discuss personal health habits used to protect customers and self.	"From Hand to Mouth," Health Department	
	5. Discuss ways germs are transmitted from one person to another through food.	Film: "Germs Take Pot-Luck," County Health Department	
	6. View film: "Safe Food - Safe Health," County Health Department. Discuss and evaluate the film.	Film: "Safe Food - Safe Health," County Health Department	Film evaluation
	7. Discuss sanitary practices related to tasting food, dishwashing, food storage, and care of work area.	Food Service Industry and Sanitation, U. S. Department of Health and Welfare	
	8. Make a collection of news items concerning violations of food handling regulations.	Newspapers and magazines	

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
B. Keeping food at the proper temperature	B. 1. Discuss, using bulletin boards, safe storage temperatures for food. Experiment with some foods to see what the safe storage temperature is and what happens to the food when not stored at the correct temperature.	Bulletin boards: Food poisoning Food-borne diseases Halls, Betty C. Food Poisoning and Food Hygiene, New York, St. Martins	Oral discussion
	2. Have students observe hot and cold storage facilities in a lunchroom or restaurant and evaluate the use of the facilities.	School cafeteria or restaurant	Evaluation of storage facilities
	3. Discuss food service regulations concerning hot and cold storage.	"Inspection Food Service Establishment Sheet," South Carolina State Board of Health	Oral discussion
	4. Show film, "Food Storage." Discuss proper and improper techniques of storing food.	"Food Storage" (T F8-1503) MP So V.W. 13 Min. U. S. Army Headquarters, Film Library	Film evaluation
	5. Make list of do's and don't's on proper storage of food.		
C. Sanitation through good housekeeping	C. 1. Discuss the danger insects and rodents present to household sanitation. Discuss the methods for controlling insects and rodents.	Sanitary Follies list Public Health Department	Check list
	2. Field trip to hospital to observe food sanitation. Write an evaluation of the hospital's methods of food sanitation.	Field trip	Written field trip evaluation
	3. Determine the various housekeeping jobs for maintaining safety and sanitation in food service establishments.		

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	4. Set up an imaginary food service establishment. Outline a plan for maintaining a safe level of sanitation.		Case problem

OBJECTIVE: TO DEVELOP SOME UNDERSTANDING OF THE SAFE USE AND CARE OF DIFFERENT TYPES OF EQUIPMENT

Time -- 3 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Use and care of equipment as related to job	A. 1. Using transparencies, identify major and small kitchen equipment. Point out the purpose of each piece of equipment.	Transparencies. Equipment catalog, National Restaurant Association, Chicago, Illinois	Identification quiz
	2. Demonstrate the use of major kitchen equipment. Have resource person from appliance company to carry out some of the demonstrations. Allow students to practice using the equipment.	Resource person Kitchen equipment	Check sheet to evaluate self on practice in using equipment
	3. Demonstrate the use of various pieces of small kitchen equipment. Emphasize using the correct piece of equipment for each job, such as french knife for chopping vegetables and slicing or utility knife for cutting large vegetables. Allow students to practice using the small equipment.	Kitchen equipment	Test - matching task to equipment used to perform that task
	4. Make a field trip to a food service institution and observe the techniques used in operating the equipment. Evaluate the techniques observed.	Field trip	Field trip evaluation
	5. Have each student prepare demonstrations on the care of one major piece of equipment and one minor piece of equipment. (Individual conferences will need to be held previous to giving the demonstrations.) Prepare leaflets on each demonstration to give to all class members.	Equipment leaflets	

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	6. Examine plans of food service institutions and discuss the storage facilities for each. Discuss special techniques which can be used to get maximum use of available storage space.	West, Wood, and Harger. Food Service in Institutions, John Wiley and Sons, Inc., New York New York	Classroom participation
	7. Adjustment and repair of equipment. (a) Discuss the importance of reading the manufacturer's manual for all equipment before operating it. Examine several manuals to see what information they contain. (b) Discuss the importance of reporting needed repairs quickly.	Kitscheva and Ternell. Care of Food Service Equipment	
B. Accident prevention	B. 1. Using a bulletin board with clippings, point out accidents common to food service areas. Discuss how each of the accidents in the clippings could be prevented.	Pamphlets: "Home Safety," S. C. Extension Service, Clemson University "Kitchen Sense," The Equitable Life Insurance Co., New York "Your Responsibility for Safety"	Check list on safe and effective work habits
	2. Point out through role-playing, precautions in operating equipment for worker and equipment protection. Discuss wage cost of the injured to the employer and and employee: (a) Cost of repair (b) Cost of working time (c) Cost of wages paid to others to do work		
	3. Show and discuss the filmstrip, "Safety in the Kitchen."	Filmstrip: "Safety in the Kitchen"	Filmstrip evaluation

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	4. Have a nurse or qualified person in first aid to demonstrate treatment of burns, cuts, bruises, scalds, electric shock, and fainting.	Resource person	Situation test (State a type of accident which has occurred and ask student what procedure would be followed.)
	5. Discuss causes of accidents: carelessness, hurrying, mechanical malfunction, incorrect use of equipment, etc. Alert students to hazards such as damp or highly polished floors, broken glass, etc. Discuss how to avoid these hazards. Use posters to illustrate.	Safety posters, National Safety Council, 425 N. Michigan Avenue, Chicago, Illinois	

FOOD SERVICE TRAINING FOR COOKS

OBJECTIVE: TO DEVELOP FUNDAMENTAL SKILLS AND KNOWLEDGE IN QUANTITY FOOD PREPARATION AND SERVICE

Approximate time -- 9 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Time, energy, and space management	A. 1. Demonstrate how different arrangements of equipment can save time required for a job. Follow demonstrations with students practicing simple tasks in arranging equipment.	Kinder, Faye. Meal Management, The MacMillan Company, New York, N. Y., 1962	Observation of practices of saving time and energy
	2. Demonstrate and direct students in practicing correct hand motions in performing food preparation tasks.		
	3. Demonstrate assembling equipment for job to be done. Have students practice.		
	4. Discuss the value of a work plan for space and time. Have students plan a meal and set up a time and space plan.		Evaluation of plans
B. Preparing foods in quantity 1. Using standardized recipes	B. 1. (a) Study standardized quantity recipes to understand symbols, abbreviations, weights, measurements, equipment, temperatures, and cooking time.	Fowler, West, Schwgart. Food for Fifty, John Wiley & Sons, Inc., New York, N. Y.	
	(b) Adjust recipes to halves and fourths and prepare simple recipes which have been adjusted.	U. S. D. A. Standardized Recipe Files. Oklahoma School Lunch File, School Lunch Room	Recipe adjustment and preparation
	(c) Panel discussion on reasons for standardized recipes.		
2. Principles of vegetable cookery	2. (a) Illustrate preparation of vegetables at high temperatures.	Holliday, Evelyn and Noble, Isabel. Hows and Whys of Cooking, University of Chicago	Check list on products of food prepared by students

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
		Press, 1959	
	(b) Compare vegetable cookery with and without a cover.		
	(c) Study time guide for vegetable cookery. Have class members prepare various types of soups: meat, vegetable, and clear.		Food preparation
3. Preparation of meats, meat substitutes and meat extenders	3. (a) Have students compile cookery terms related to meats to better understand protein cookery.	Recipe book	
	(b) Discuss principles of protein cookery. Prepare some examples of protein foods which have been prepared correctly and others which have been prepared incorrectly. Compare and contrast these according to: (1) flavor, (2) texture, (3) appearance, and (4) nutritive value.	Food Service in Institutions, John Wiley & Sons, Inc., New York, N. Y.	Written evaluation on principles of protein cookery
	(c) Discuss the use of meat substitutes to: (1) provide variety in meals, (2) lower the cost of meals. Have students plan menus using meat substitutes.		
	(d) Discuss the use of meat extenders. Have each student bring in a recipe of a meat extender dish. Compile recipes.	Recipes	Menu plans

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	(e) Demonstrate the preparation--scaling, deveining, etc.--of various types of seafoods. Scan recipe books to gain understanding of the variety of ways in which seafood can be prepared.	Recipe books	
C. Serving food	C. 1. Discuss methods of keeping food at correct serving temperature, and the safe length of time for keeping food at correct temperature for serving.	Food Service in Institutions, John Wiley & Sons, Inc., New York, N. Y.	
	2. Demonstrate arranging food (a) on a steam table, (b) on trays, (c) on plates. Give students several menus and have them plan pleasing arrangements for each of these different types of serving.		Evaluation of arrangements
	3. Discuss suitable serving portions.		

FOOD SERVICE TRAINING FOR WAITRESSES

OBJECTIVE: TO DEVELOP FUNDAMENTAL KNOWLEDGE AND SKILLS NEEDED TO BE A WAITRESS

Time -- 9 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Sanitary methods in handling food and tableware	A. 1. Demonstrate the correct methods of handling silverware, glassware, dinnerware, and food: (a) When setting a table. (b) When serving food. (c) When storing tableware. (d) When cleaning tableware. (e) When clearing a table. Allow students to practice these methods.	McDermott and Nicholas. Homemaking for Teenagers, Revised Edition, Book I	
	2. Show film, "Waiter-Waitress Training," and evaluate the methods of handling food and tableware shown in the film.	Tableware film: "Waiter-Waitress Training," Associate Films	
B. Table setting	B. 1. Demonstrate different types of table settings.	Tableware	
	2. Evaluate, using opaque projector, several table settings found in magazines.	Opaque projector Magazines	
	3. Observe when and how condiments are placed on tables in several restaurants. Discuss observations.		
	4. Create attractive restaurant table settings.		Evaluation of table settings
	5. Use a score card for checking practices in setting a table.		

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
C. Procedures and techniques of waiting on a table	C. 1. Discuss courteous ways of greeting customers. Role play some of these.		Observation
	2. Demonstrate: (a) taking orders, (b) giving orders to cook, (c) serving various types of foods, (d) placing of food and beverages on the table, (e) waitress checking with customer for satisfaction, (f) taking dessert orders, (g) clearing the table, (h) correct way to use trays, (i) techniques of arm service. Follow each demonstration with a practice session.		Observation of practice
	3. Make a glossary of menu terms, such as "a la carte," and study them.	Cookbooks, menus, etc.	Objective test on menu terms
	4. Collect samples of food checks to see the techniques used in writing orders. Make a checklist for accuracy in taking orders. Practice taking and writing orders.	Check list Order pads	
	5. Study the sequence and techniques in serving meals of several food courses. Practice serving a meal with several courses.	Tableware	Evaluate practice of meal service
	6. Develop a list of attributes which "sell" customers. Include: (a) checks for completeness of service,		

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	(b) writes sales check legibly, (c) pleasant facial expression, (d) pleasant manner of speaking, (e) efficient in handling food, (f) serves correctly.		
D. Preparation of salads	D. 1. Show and evaluate filmstrip, "Preparation of Salad."	Filmstrip: "Preparation of Salad"	
	2. Demonstrations on washing, scrubbing, scraping, peeling, sorting, chopping, slicing, quartering, cubing, shredding, and dicing salad materials with use of proper equipment. Practice after demonstrations.		Observe students in performing these skills.
	3. Make a field trip to a restaurant and observe the methods used to store salad materials. Discuss why these methods are used.		
	4. Discuss the proper methods of opening canned materials for salads.		
	5. Discuss, using transparencies, the appearance of salads. Emphasize (a) how and when to combine tossed salads to preserve fresh appearance, (b) the use of color in salads, (c) the relationship of proper refrigeration to appearance of salads, (d) arranging of salads to create a good appearance.	Transparencies	Written evaluation of the appearance of several salads from magazines

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	6. Show filmstrip, "Song of the Salads." Evaluate, as film is shown, the salads in the film. List ways in which their appearance might be improved.	Filmstrip: "Song of the Salad," H. J. Heinz Company	Evaluate filmstrip
	7. Discuss the principles involved in making salad dressings.		
	8. Prepare a variety of salad dressings.	Recipes	
	9. Demonstrate preparation of congealed salads, removing congealed salads from containers, and serving them.		

FOOD SERVICE TRAINING FOR LUNCH ROOM WORKERS

Objectives

To gain a better understanding of the safe handling of food and its relationship to personal health practices and sanitary housekeeping methods.

To gain a better understanding of the importance of following tested recipes in preparing a lunch.

To learn more about the Type A School Lunch.

To develop increased ability in selecting and arranging the proper equipment to use for various tasks.

To realize that proper use of equipment can prevent accidents.

To develop increased ability to apply the principles of nutrition in the maintenance of good health.

To develop increased awareness of the nutritional needs of children and teenagers.

OBJECTIVE: TO DEVELOP INCREASED ABILITY IN ARRANGING AND USING EQUIPMENT

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. The value of work schedules and proper arrangement of equipment	A. 1. Discussion: Good and poor working habits.	Cronan. Foods in Homemaking	Interest shown by trainees
	2. List job responsibilities of each person in the lunchroom.	Cronan. The School Lunch	
	3. Tour of kitchen: Study the methods used in storing equipment and food.	The school lunchroom	
	4. Have trainees suggest changes in arrangement of storage areas to save time and energy.		
	5. Show filmstrip, "Organizing and Preparing Meals." Discuss how planning helps save time and energy.	Filmstrip: "Organizing and Preparing Meals," McGraw-Hill	
	6. Make a work schedule that can be used in preparing a simple lunch.	"Palmetto Lunches," March, 1965	Observation of trainees at work
	7. Plan, prepare and serve a simple lunch, following the work schedule, which will illustrate how proper planning and arrangement of tools can speed up work and save time and energy.		Meal evaluation

OBJECTIVE: TO GAIN A BETTER UNDERSTANDING OF THE SAFE HANDLING OF FOOD, AND ITS RELATIONSHIP TO PERSONAL HEALTH PRACTICES AND SANITARY HOUSEKEEPING METHODS

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Sanitary procedures	A. 1. Discuss essential health practices of lunchroom workers. (a) Personal cleanliness and good grooming (b) Care of hair (wearing a hair net) (c) How to avoid spreading a cold (d) Sanitary practices related to tasting foods, dishwashing, food storage, and care of work area (e) Importance of physical examination and testing (f) Health card	Personal sanitation checklist for lunchroom workers Cronan. The School Lunch S. C. laws relating to food service in boarding houses, hotels, and motels	Observation of participation in the discussion
	2. Discuss the importance of strict sanitary control in handling foods. Have a resource person from the local health department lead the discussion. (a) Prevention of spoilage and contamination (b) Temperatures for safe refrigeration (c) Care of food in the refrigerator and storeroom	Resource person - local health department S. C. State Board of Health Inspection, "Report of Food Service Establishments" "Sanitation Follies," Public Health Committee of the Paper Cup and Container Institution Booklet: "Palmetto Lunches," March, 1965	
	3. Show and discuss chart on types of food poisoning. Give an illustrated lecture on how food poisoning spreads.	Chart from: Cronan. Foods in Homemaking, "The Spread of Food-Borne Diseases"	Objective test

OBJECTIVE: TO GAIN A BETTER UNDERSTANDING OF THE SAFE HANDLING OF FOOD, AND ITS RELATIONSHIP TO PERSONAL HEALTH PRACTICES AND SANITARY HOUSEKEEPING METHODS

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Sanitary procedures	A. 1. Discuss essential health practices of lunchroom workers. (a) Personal cleanliness and good grooming (b) Care of hair (wearing a hair net) (c) How to avoid spreading a cold (d) Sanitary practices related to tasting foods, dishwashing, food storage, and care of work area (e) Importance of physical examination and testing (f) Health card	Personal sanitation checklist for lunchroom workers Cronan. The School Lunch S. C. laws relating to food service in boarding houses, hotels, and motels	Observation of participation in the discussion
	2. Discuss the importance of strict sanitary control in handling foods. Have a resource person from the local health department lead the discussion. (a) Prevention of spoilage and contamination (b) Temperatures for safe refrigeration (c) Care of food in the refrigerator and storeroom	Resource person - local health department S. C. State Board of Health Inspection, "Report of Food Service Establishments" "Sanitation Follies," Public Health Committee of the Paper Cup and Container Institution Booklet: "Palmetto Lunches," March, 1965	
	3. Show and discuss chart on types of food poisoning. Give an illustrated lecture on how food poisoning spreads.	Chart from: Cronan. Foods in Homemaking, "The Spread of Food-Borne Diseases"	Objective test

OBJECTIVE: TO GAIN A BETTER UNDERSTANDING OF THE IMPORTANCE OF FOLLOWING TESTED RECIPES IN PREPARING A LUNCH

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Understand and follow recipes	A. 1. Discuss the importance of following a recipe in quantity cookery.	Cronan. Foods in Homemaking Cronan. The School Lunch	
	2. Analyze recipes according to: (a) Abbreviations (b) Cooking terms - Show and discuss filmstrip, "Understanding Cooking Terms," McGraw-Hill (c) Measurements (1) Liquid (2) Dry Show and discuss filmstrip,"Measuring Accurately," McGraw-Hill	Recipe file Standard abbreviations Filmstrip: "Understanding Cooking Terms," McGraw-Hill Filmstrip: "Measuring Accurately," McGraw-Hill	Objective test on parts of a recipe. Cooking term cross-word puzzle, Evaluation in Home Economics, The Indiana Home Economics Association, 1964
	3. Demonstrate how to multiply or divide a recipe. Give students some practice problems.	Recipe file	Evaluation of practice problems
	4. Discuss standard substitutions in a recipe and learn the most common substitutions.	Cronan. Foods in Homemaking Handbook of Food Preparation, American Home Economics Assoc.	

OBJECTIVE: TO LEARN MORE ABOUT THE TYPE A SCHOOL LUNCH

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Planning the Type A lunch for the school lunch-room	A. 1. Discuss what is included in a Type A lunch.	Chart of Type A lunch	Question and answer session
	2. Discuss the nutritional advantages of the Type A lunch.	Cronan. The School Lunch	
	3. Discuss the use of U.S.D.A. commodities in meal planning.	Cronan. The School Lunch	
	4. List several ways to use U.S.D.A. commodities in Type A menus.	Group participation	
	5. Have class work out new recipes using U.S.D.A. commodities.	Group participation	Observation of group participation
	6. Have groups test new recipes.	U.S.D.A. commodities	Testing new dishes prepared
	7. Plan Type A menus using as many U.S.D.A. commodities as possible.	Menu forms for Type A lunch	Evaluation of menus
	8. Have a lunchroom supervisor demonstrate how the cost of a menu is determined. Give class menus and have them work out the cost.	Resource person - lunchroom supervisor	Evaluation of menus
	9. Plan, prepare, and serve a Type A menu using as many U.S.D.A. commodities as possible.	Group participation U.S.D.A. commodities	Evaluation of meal
	10. Select and use proper equipment for serving a Type A lunch.	Kitchen equipment	

OBJECTIVE: TO DEVELOP INCREASED ABILITY IN SELECTING AND ARRANGING THE PROPER EQUIPMENT TO USE FOR VARIOUS TASKS

TO REALIZE THAT THE PROPER USE OF EQUIPMENT CAN PREVENT ACCIDENTS

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. The care and use of equipment	A. 1. Have resource person demonstrate use and care of major equipment used in the lunch rooms.	Representative from power company.	
	2. Demonstrate use and care of miscellaneous equipment.	Cutlery and other small equipment	
	3. Demonstrate precautions in operating equipment. (a) Protection of worker (b) Protection of equipment	Cronan. The School Lunch	
B. Prevention of accidents	B. 1. Discuss common accidents that may occur in the school lunch room.	Filmstrip: "Safety in the Kitchen," McGraw-Hill	
	2. Show and discuss filmstrip, "Safety in the Kitchen."		
	3. Discuss causes of accidents.	Cronan. The School Lunch	
	4. Discuss and list several safety precautions for lunchroom workers.		
	5. Demonstrate precautions in operating equipment.	Cronan. The School Lunch	
	6. Discuss what to do in case of an accident.	Red Cross, First Aid Handbook	

OBJECTIVE: TO DEVELOP INCREASED ABILITY TO APPLY THE PRINCIPLES OF NUTRITION IN THE MAINTENANCE OF GOOD HEALTH

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Principles of nutrition and their relationship to good health	A. 1. Discuss health and how it affects personal appearance.	Cronan and Atwood. Foods in Homemaking Rathbone, Bacon, Keene. "Health in Your Daily Living"	Participation in the discussion
	2. Discuss the main factors which have contributed to longevity of life.	Better Homes and Gardens, Family Medical Guide	Evaluating personal health habits
	3. List evidences of good and poor nutrition.	Charts - characteristics of good and poor nutrition	Question and answer session
	4. Study and discuss the food nutrients in relation to good health.	Lewis. Family Meals and Hospitality	Oral discussion
	5. Study and discuss food fads and fallacies.	Peyton. Practical Nutrition	Student participation
	6. Discuss the importance of breakfast and its relationship to the development of desirable work habits.	Peyton. Practical Nutrition Howe. Nutrition for Practical Nurses	
	7. Discuss the nutritional needs of the trainee and her family.	Chart: Basic four evaluation check sheets	
	8. Plan menus, using food models, to meet the nutritional needs of the families. Evaluate this planning after seeing the filmstrip, "Planning Meals for Nutrition."	Flannel board display of food models, National Dairy Council Filmstrip: "Planning Meals for Nutrition," McGraw-Hill	Menus planned

63

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	9. (a) Show filmstrip, "Serving Meals More Attractively." (b) Plan, prepare, and serve a well-balanced day's diet, incorporating the film ideas (breakfast, dinner, and supper).	Filmstrip: "Serving Meals More Attractively," McGraw-Hill	Performance
B. Dietary requirements for various stages of growth and development	B. 1. Discuss the nutritional needs of elementary children.	Howe. Nutrition for Practical Nurses	Observation of interest shown by questions asked
	2. Discuss the nutritional needs of teenagers.	Cronan. Foods in Homemaking	Question and answer session
	3. Plan menus to meet the needs of growing boys and girls.	Cronan. The School Lunch	Evaluation of menus

SUGGESTED PROGRAM FOR INTERIOR DESIGN AIDE

Introduction

The following course outline has been prepared for use in teaching students to become interior design aides. Specific types of skills needed will be influenced by the students' abilities, job opportunities, and facilities available. The learning experiences in this material are only suggestions and should be adapted to the local program. For high school classes, a one hour class meeting per day for thirty-six weeks, or 180 hours, with 40 or 50 additional hours of work experience is suggested. For adults who have ability in sewing, perhaps 120-130 hours of class meetings, with 30 or 40 hours of work experience, could be planned.

Objectives

To develop personal characteristics needed in getting and holding a job.

To develop good work habits.

To become aware of vocational opportunities in the community.

To develop an understanding of the services provided by interior designers and home furnishing departments in department stores, furniture stores, and specialty shops.

To develop some ability in the use, care, and storage of equipment.

To become familiar with the materials used in drapery-making.

To develop skills needed in making draperies.

To be able to construct curtains.

To be able to construct bedspreads.

To develop some ability in accurately reading and following directions and making decisions for adaption to unusual window treatments.

OBJECTIVE: TO DEVELOP PERSONAL CHARACTERISTICS NEEDED FOR JOB SUCCESS

Time -- 1 week

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Personal characteristics needed for job employment	A. 1. List desirable characteristics needed in a worker. 2. Discuss reasons why the listed characteristics are needed. 3. Consult references on characteristics of workers and add to list.	Bulletins: "Your Personality and Your Job" "Exploring Your Personality" Film: "How to Get a Job" Filmstrip: "At Home and in Public"	Rating scale on personal qualities
	4. Discuss each of the personal qualities of a good worker in terms of: (a) What is meant by this quality? (b) How can one develop this quality? (c) How can one improve this quality? (d) How can one maintain and keep this quality?	Bulletin: "What is Honesty?" Films: "Personal Qualities for Job Success" "Am I Trustworthy?	Self-evaluation by trainee Keep anecdotal record of strong and weak characteristics. Keep for files and records.
	5. Have groups identify ways these qualities must be practiced in carrying out the responsibilities of an interior design aide.		
	6. Have trainees write a paper on "The Kind of Person I Want to be as an Interior Design Aide."		Written report

OBJECTIVE: TO BECOME AWARE OF THE VOCATIONAL OPPORTUNITIES IN THE COMMUNITY

Time -- 3 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Changing role of women	A. 1. Discuss and read about the changing roles of women in society. Buzz groups: Subject - "Combination Homemaker and Wage Earner."	Bulletin: "Keys to Fulfilling the Dual Role of Women"	Question and answer period Checklist: "Role of Women"
B. Job opportunities	B. 1. List possible jobs within the interior design area.		Checklist: "Job Opportunities"
	2. Have interview with person in interior design on job opportunities in her profession. Report findings to class.	Personal interview	
	3. View and discuss film, "Choosing Your Occupation."	Film: "Choosing Your Occupation"	Film evaluation
C. Job application	C. 1. Skit: "Who Gets the Job?"	Bulletins: "How to Get a Job" "A Job for You" "How to Get and Hold a Job"	
	2. Study procedures used in job interview. Have a mock interview to illustrate the procedures used in an interview.	"Your Job Interview"	Evaluation of mock interview
	3. Symposium: "Applying for a Job."		
D. Employer-employee relations	D. 1. Resource person: Employer's report on "What is Expected of an Employee."	Resource person	Question and answer period
	2. Role play relationship problems which may occur on a job. Discuss the problems and solutions to them.		

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
E. Work experience	E. 1. Plan work experience: Prepare personnel data sheets for employer, student, and parent. 2. Teacher-student conferences in preparation for work experiences.	Bulletin: "Job Guidance for Your Workers"	Personnel data sheets Student-teacher conference

OBJECTIVE: TO DEVELOP SOME ABILITY IN THE USE, CARE, AND STORAGE OF EQUIPMENT

Approximate time -- 1 week

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Use, care, and storage of equipment	A. 1. Review through demonstrations: (a) Parts of the sewing machine (b) Threading upper and lower machine (c) Machine stitching Allow students to practice individually after the demonstrations.	Parts diagram, threading charts - Singer Company	Performance test
	2. Working individually, practice cleaning the sewing machine.	Cleaning equipment: machine oil, dust cloth, brush, and screw driver	Evaluation of practice session
	3. Demonstrations: (a) Types of storage (1) sewing boxes (2) tote trays (3) adjustable shelves (4) closets (b) Pressing equipment (c) Small equipment - yard stick, scissors, needles, pins, etc.	Materials needed in demonstrations	How well equipment is kept and stored
	4. Readings on machine safety	Pamphlets: Safety booklets - National Safety Council	Self-evaluation
	5. Buzz session on safety		

OBJECTIVE: TO BECOME FAMILIAR WITH THE FABRICS USED IN DRAPERY MAKING

Time -- 4 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Fabrics used in making draperies and their characteristics	A. 1. Exhibit of swatches of drapery material.	Swatches from J. C. Penny Company and Sears Roebuck and Co.	Buzz session Question and answer period
	2. Define kinds of drapery fabrics and discuss characteristics of each.	Books: Wingate, I. Textile Fabrics and Their Selection, Prentice Hall, Inc., 1964 Craig, Hazel & Rush, Ola. Homes With Character, D. C. Heath & Company, 1962 Pamphlet: "Window Beauty," Kirsch Co.	Group participation
	3. Visit fabric house to see the different kinds of fabrics. Have resource person from fabric house point out the distinguishing characteristics of the different types of drapery fabrics.	Resource person Field trip	Questions and answers
	4. Collect sample swatches to illustrate the various types of drapery fabrics.		Identification quiz

OBJECTIVE: TO DEVELOP SKILLS NEEDED IN MAKING DRAPERIES

Approximate time -- 12 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. How to take measurements and determine yardage	A. 1. Practice measuring windows in department, home, and lounge at school and work out the yardage for the windows measured.	Windows: 1001 Decorating Ideas, Conso, Inc. How to Make Draperies, Singer Company The Wise Encyclopedia of Modern Sewing, Wm. H. Wise & Company, Inc.	Group participation
B. Basic construction processes	B. 1. Demonstrate the methods of construction used to make the different types of draperies. Use transparencies to show how they differ in appearance. 2. Practice work - laboratory or community. 3. Discuss standards for construction.	Materials purchased by school for classroom and/or teachers' lounge Transparencies of different types of draperies	Performance test
C. Construct lining for draperies. Seams and finishes for draperies.	C. 1. Practice skills: (a) How to cut lining (b) Seams and finishes for draperies 2. Make miniature draperies which illustrate construction and lining processes learned.	Materials for making draperies and linings Miniature draperies made by class members	Performance test

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
D. How to add trimmings to draperies	D. 1. Discuss, using transparencies, the kinds of trimmings and how they are used: (a) Headings (b) Scallops (c) Cordings (d) Fringe	Demonstration kit by Conso, Inc. Transparencies	Self-evaluation Work sheet to follow outline of jobs
	2. Demonstrate procedure for adding various types of trimming to draperies.	Books: Craig, Hazel and Rush, Ola. Homes With Character, D. C. Heath and Company, 1962 Singer Home Decorating Sewing Book	Questions and answers
	3. Examine samples of each type of trimming. Add trimming to the miniature draperies made.	Miniature draperies	Short answer test
E. How valences are made	E. 1. Discussion: How to make valences		
	2. Demonstration on valences by resource person	Resource person and materials for demonstration	
	3. Class participation and practice work	Miniature valence	Performance

OBJECTIVE: TO BE ABLE TO CONSTRUCT CURTAINS

Time -- 6 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Processes involved in making curtains	A. 1. Individual class members give demonstrations one one of the following processes used in making curtains. (Arrange for individual conferences to help plan and prepare demonstrations.) Encourage use of visual aids such as posters, transparencies, etc., to accompany demonstrations. (a) How to buy material (b) Cutting (c) Basting (d) Stitching (e) Lining (f) Trimming (g) Hemming	Demonstrations	Checklist on techniques used in demonstration Product examination
	2. Discuss the different types of curtains. Use the opaque projector to illustrate the different types as found in magazines, catalogues, etc.	Pictures of different types of curtains	Identification of types of curtains
	3. Compare and contrast correctly made curtains with commercially made curtains which students bring from home. Identify the construction processes used and evaluate them.	Tailored and commercially made curtains	Analysis of processes and their quality

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
	4. Set up an exhibit of the commercially made products which help to give curtains a professional look, such as: cording, fringe, heading materials, pleater tape, weights, etc. Explain the purpose of each product, giving actual examples or using the overhead projector with transparencies.	Exhibit products used in making curtains with examples of their use or transparencies illustrating their use	Use of products in experience

OBJECTIVE: TO BE ABLE TO CONSTRUCT A BEDSPREAD

Time -- 6 weeks

CONCEPTS	LEARNING EXPERIENCES	TEACHING MATERIALS	EVALUATION
A. Steps involved in making a bedspread	A. 1. Give demonstrations on the processes used in making a bedspread. Include: (a) Measuring (b) Estimating material (c) Basting (d) Stitching (e) Trimming (f) Lining	Demonstrations	Illustrative materials
	2. Have question and answer session after each demonstration.		
	3. Students make samples to illustrate each of the processes in making a bedspread.		Samples

APPENDIX

HOME ECONOMICS INSTRUCTIONAL PROGRAMS SERVE TWO MAJOR PURPOSES

Preparation for Homemaking

These programs

- are broad in scope, including all areas of home and family living.
- are based on individual and family needs.
- are appropriate in every secondary school.
- include supervised home experiences.
- are open to all interested students.
- are provided in grades 7 through 12, and for post-high school.
- are evaluated in terms of use being made in personal and home life of students.

Preparation for Occupational Employment

These programs

- are focused on a specific occupation.
- are based on a job analysis of occupations.
- are established only when evidence shows employment opportunities exist.
- include supervised work experience.
- are offered only to students who have interest and aptitude for a specific occupation.
- are offered to students who will be of legal age at completion of course(s).
- are evaluated in terms of student's performance on job.

DIFFERENCES IN TWO ASPECTS OF HOME ECONOMICS PROGRAM

Home Economics for Homemaking	Home Economics for Employment
Total curriculum is broad in scope and content.	Curriculum is based on the job analysis of a specific occupation.
Attitudes and behavioral development necessary for strengthening family well-being are stressed.	Emphasis is placed on the development of attitudes and behavior necessary to secure and hold a job.
All students are accepted because of the belief that they can benefit from the program.	Qualities and aptitudes are the bases for selecting enrollees in a specific job-oriented program.
Marriage and maintaining a home are common to practically everyone, so programs are justifiable in all communities.	Programs are established only when evidence shows sufficient job opportunities are available for placement of trainees.
Counseling is most valuable in development of personal and family values.	Vocational counseling service is necessary to help the teacher in determining needs, employment opportunities, and placement of students in the most satisfactory program.
Advisory committees have been "recommended" but not required.	The establishment of a local advisory committee helps to determine work available and to advise and evaluate the specific emphasis of the training program.
Immediate evaluation of programs in home economics is difficult.	Evaluation is in terms of performance and the ability to get and hold jobs.

Taken from the National Conference on Contemporary Issues in Home Economics Education, University of Illinois, May 9-11, 1965.

CRITERIA TO USE IN DRAWING IMPLICATIONS FROM FINDINGS OF A SURVEY OF LOCAL COMMUNITY

1. Is there evidence that there is a need for a training program using home economics knowledge and skill which would possess the potential of making a contribution: to the decreasing of unemployment, to raising economic status of individuals in low-income groups; to reducing dropouts; and/or to increasing the employability of some youth and adults?

2. Will employment be available for those who successfully complete the course?

3. Are there enough prospective students who are interested in taking the course to meet the standards of the local school and the state requirements?

4. Can specific implications be drawn from findings in relation to curriculum development:

   a. Competences - Have the specific skills, knowledge, understandings, attitudes, and levels of performance for each been identified?

   b. Factor for selection of students - Have the personal characteristics and abilities desired by employers of prospective employees been identified?

   c. Learning experiences - Can a job analysis be developed so that learning experiences, teaching methods, and evaluation procedures can be effectively planned?

   d. Resources - Has it been possible to identify the resources needed--reference materials, audio-visual aids, equipment, and facilities--and the availability of such?

   e. Work experiences - Can there be adequate work experiences provided?

   f. Length of course - Is it realistic to expect that the desired competences can be developed in the amount of time suggested for the duration of the training program?

   g. Evaluation - Will it be possible to cooperatively evaluate progress throughout the training program?

Taken from a study made by June Cozine, Oklahoma State University, entitled "Approaches to Use in Assessing Needs for, Content of, and Certain Factors to be Considered in Offering Home Economics Courses Preparing for Gainful Employment, Project No. OE-5-85-088."

JOB ANALYSIS

"The typical vocational education program in the high school, regardless of its organizational pattern, is designed to achieve certain goals and is organized and scheduled accordingly. Since the purpose of vocational education is to prepare individuals for entry into an occupation, course content is determined by an analysis of what the worker must know and be able to do to be successful in that occupation."[1] This job analysis serves as a basis for program planning in helping to identify the objectives, understandings, skills and abilities to be acquired by the individual to be successful on the job.

An analysis is a cooperative venture. It is made by means of observations, interviews with workers, managers, and supervisors. It may be prepared by a teacher, manager, worker, or by occupational specialists and qualified professional personnel.

In making an analysis the job is first specifically defined. The definition includes the answers to these three questions:[2]

1. What is done?
   An analysis of what the worker does identifies the duties, tasks, or functions performed by the worker.
2. How is it done?
   A description of how a job is done includes the skills and abilities needed by the worker.
3. Why is it done?
   An answer to this question identifies the knowledge, understandings, principles, attitudes required for successfully performing the job.

A careful study of a job definition or description will also help determine:

1. The qualifications of enrollees as to

   - the minimum educational background necessary for trainees.
   - the maturity level of enrollees. This is influenced by amount of responsibilities to be carried by the worker, the probability and effect of mistakes which might be made on job in terms of added costs, customer relations, and human development.
   - the aptitude, interests, and temperament needed by workers. This will be helpful in setting up criteria for selection of enrollees.

2. The length of the training course

   - the number of weeks or months of training that is necessary for enrollee to learn the job.

3. The equipment needed

---

[2]Employment Security Review, "The New Dictionary of Occupational Titles," February, 1963, by A. B. Eckerson.

JOB RELATED WORK EXPERIENCE

Some Prerequisites for a Successful Work Experience Program

A. The school administration and the total faculty understand the objectives of the work experience program and are supporters of the program.

B. The objectives of the program are educational in nature.

C. The teacher-coordinator visualizes the objectives broadly.

D. The school curriculum is flexible so that students in the work experience program can participate fully in all of the school's activities.

E. Parents of high school students thoroughly understand the purpose of the program.

F. The teacher-coordinator makes careful plans with cooperating businesses so that there is thorough understanding of the undertaking.

G. The businesses providing work opportunities are carefully selected as places where students will get constructive types of experience.

H. Students are provided with a thorough orientation to work in the modern business community.

I. The teacher has some independent check on the effectiveness of the student in the work situation.

J. The teacher provides direction for the experience on the job and is able to integrate the work experience with classroom learnings.

K. The teacher is fully aware of what is happening on the jobs and is able to integrate the work experience with classroom learnings.

L. Careful attention is given to the development of self-evaluation on the part of student workers.

M. The teacher-coordinator is allowed sufficient time to visit students, to talk with them in personal conferences, and to talk with their work supervisors.

N. The teacher-coordinator evaluates the total program periodically to determine the extent to which objectives are met.

Excerpts taken from American Vocational Journal, January, 1961.

OBSERVATION - CHILD CARE AIDES

Observation can be done in:

1. Sunday schools
2. Hospitals
3. Churches
4. Child development centers
5. Head Start program
6. Institutions for people with special needs

The observation should be made of groups of children of 10-15 per group. Single observation of one child is not desirable.

The ideal situation is to use the laboratory already set up as a teaching and learning situation, as in a college.

Observation may be made in both good and poor situations for discussion purposes before students have actual practice and teaching experiences.

How to Visit

Report to the office or director or manager when you arrive at school, institute, or business. Be prompt.

If there are written instructions for visitors, read them carefully and observe the rules.

Sit or stand out of the way of workers or other personnel.

Do not talk to the workers or to each other if you go in a group. If a person addresses you, reply courteously, but do not engage him in conversation.

Keep your purse and personal belongings with you, or leave them in a designated place.

Do not handle or touch things unless asked to do so.

Write down any questions you may wish to discuss with the director during the time allotted for this.

Leave promptly when the visit is supposed to end.

Procedures

Since observation of the pre-school, institution, or organization should neither interfere with routine of the school nor upset the children or workers, careful planning is necessary.

1. The number of observers should be limited so that their presence will not interfere with the normal routine.

2. The observers should be placed where they will not in any way interfere with activity. (The most desirable location is behind a one-way vision screen when possible.)

3. Preparation for observation should include:

   a. Permission from the school in advance of the visit.

   b. A statement of what is expected of the observer and of what he may expect.

   c. An observation form may be provided to help the observer note specific things.

   d. Provision for time at the close of the observation for observer and staff member to discuss what has been seen.

   e. A simple explanation to the workers or children about observers if the observer must be in the room with the children. Presence of visitors may tend to excite children and to make them self-conscious.

SELECTION OF TEACHERS - BASIC COMPETENCIES NEEDED*

Horn listed four (4) competencies for teachers in emerging programs:

1. Utilization of the most up-to-date techniques required to do the job.
2. Possession of a thorough foundation in the knowledge and skills involved in the job.
3. Ability to identify concepts and to generalize.
4. Cooperation with the administration, employment agencies, and potential employers in the development of the course.

Technical competencies which seem reasonable to expect of the teacher engaged in occupational education include:

1. Integrates philosophy of life, philosophy of education, and philosophy of occupational education as a basis for thought and action.[1]
2. Possess up-to-date knowledge regarding technical matters related to the practice of a specific occupation or cluster of occupations.
3. Visualizes the relationship between the cognitive and manipulative elements of specific occupations or clusters of occupations and bridges the gap.
4. Possesses basic skills required to perform effectively in the occupation(s).
5. Structures the teaching-learning situation in a manner as to enhance the acquisition of cognitive and manipulative elements of the occupation.
6. Advises and stimulates students to develop to their fullest capacity.
7. Communicates with and relates to people--student, vocational leaders, industry representatives and others--whose cooperation and assistance facilitate program planning and implementation.
8. Builds a close liaison between industry and other potential employees and the individuals who ultimately will assume some responsibilities for fulfilling their personal needs.
9. Demonstrates an understanding of the concept of culture as "an attitude" rather than an attribute of a specific vocation.

---

*From a paper presented at the Seminar for Home Economics Leaders, Columbus, Ohio, by Dean Flossie M. Byrd, School of Home Economics, Prairie View A & M College, Texas.

[1]This competence taken from the University of Nevada Seminar. Material has been revised in a manner appropriate for teachers who are not home economics oriented who may be employed in the program. It is to be expected that for home economics education graduates the competence could remain as stated in the original materials.

Personal competencies include:

1. Exemplifies a quality of feeling about her work--a commitment to her role and the objectives of the program--personal involvement.
2. Recognizes the dignity of work to students--any work which prepares for salable skills at the secondary, post-high school or adult level.
3. Transmits respect for the dignity of work to students.
4. Possesses the capacity for empathy and openmindedness.
5. Possesses a passion for ordering, knowing and creating reality for oneself and the individuals being taught.
6. Maintains psychic resiliency.

CUES FOR THE TEACHERS

It has been said that "success" is being able to do what one can do well with pride and enjoyment.

Helping students to explore paths that enable them to make choices ultimately leading to "success" could well be the overall objective of the teacher who will bring this resource unit to life for the learner.

Following are some "cues" that can be helpful in planning an implementation:

1. Keep informed as to needs of the community and surrounding area market for job opportunities.
2. Develop a cumulative resource person file with evaluative notations.
3. Plan learning experiences that will stimulate students' interest and desire to do further individual exploration.
4. Make use of Advisory Committee members representing various kinds of jobs and careers, to learn more about the realities of specific aspects of work and as resources for students.
5. Be alert to differences in abilities of students and provide information about opportunities that might be appropriate for each individual.
6. Grow in understanding and knowledge of students' social, economic and home backgrounds. Plan approaches, methods and evaluation of progress in relation to their undertakings and knowledge.
7. Provide some first hand experiences whenever possible in "work" situations such as assisting a skillful chef, manager in the school lunchroom, dressmaker or nursery school teacher.
8. Plan for individual or group observations of people on the job in the clothing production and food processing plants, nursing homes, pediatric wards, child care centers, etc.
9. Have field trips for whole class when new job possibilities and nature of work and conditions can be best observed and evaluated.
10. Provide for "success promoting" laboratory experiences in the Home Economics Department for the purpose of exploration of basic skills, understanding and attitudes needed in various aspects of home economics employment.

From State of New Jersey, Department of Education, Vocation Division, Trenton.

FOLLOW-UP OF GRADUATES

A carefully planned follow-up on each graduate can be helpful in evaluating and revising the program.

Graduates can judge:

1. Quality of training they received.
2. Appropriateness of training they received.

Kinds of evaluations:

1. Interviews
2. Questionnaires

Frequency of follow-up:

1. Depends on help available.
2. Contacts should be made one year following graduation, then five years later.

The questionnaire includes:

1. Name
2. Address
3. Marital status
4. Number of children
5. Employment status
6. Plans for work if not employed
7. Name and address of employer
8. Job title
9. Length of employment
10. Description of specific duties involved in the job
11. Courses or types of experiences not included in the training program
12. Evaluation of length and quality of participation experiences
13. Evaluation of equipment used during training program
14. Evaluation of sequence of course presentation

VISUAL AID SUGGESTIONS*

A. Flannel Boards and Magnetic Boards

B. Three Dimensional Models

*(Taken from: Illinois Teacher of Home Economics, "Visual Aids for the New Dimension in Home Economics," Vol. 8, No. 6, 1964-65, pp. 358-370.)

C. The Bulletin Board

Use the bulletin board as a developmental device through action methods, such as adding one key at a time when discussing: "Keys to Fulfilling the Dual Role of Women."

D. Posters, Charts, Flip Charts, and Flash Cards

A B C's of an interview:

Ask questions needed for job information.

Be relaxed and alert.

Consider the interviewer's time.

Dress appropriately.

Express interest in the work.

Find ways to express appreciation for interview.

*ELECTRONIC DATA PROCESSING; *CAREER PLANNING; *OCCUPATIONAL GUIDANCE; *EDUCATIONAL GUIDANCE; COMPUTERS; HIGH SCHOOL STUDENTS; OCCUPATIONAL INFORMATION
*PROJECT COMPUTERIZED VOCATIONAL INFORMATION SYSTEM; PROJECT CVIS; WILLOWBROOK HIGH SCHOOL; VILLA PARK ILLINOIS

The project described in this report is designed to use computer technology as a tool to do a better job of systematizing, retrieving, and applying masses of information for the purpose of helping high school students make better-informed career and educational choices. The information gathered includes student personal data, occupational briefs, college information, trade-technical-school-apprenticeship data, and local job opportunities. The system is viewed as an automated library of information and provides for the student a model for decision-making. A two-dimensional job classification system, developed by Dr. Anne Roe, and explained in her book "The Psychology of Occupations," will be used to divide occupations into six levels, according to amount of training required and degree of responsibility assumed by the worker, and into eight categories of interest. Objective data about every student will be related to the job classification system and put in computer storage. By means of an automatic typewriter, students and counselors can recall information about 650 occupations, over 3000 colleges, scholarships, local technical and trade schools, local entry jobs, and the student's total school record. The system should be in operation in January, 1969. (PS)

ACKNOWLEDGMENTS

The Project Committee is particularly grateful for the work being donated by the J. G. Ferguson Publishing Company of Chicago in the preparation of occupational briefs.

The Committee is also indebted to Dr. Anne Roe, formerly of Harvard Graduate School, for her job classification system. The permission of her publisher, John Wiley and Sons of New York, is likewise appreciated.

I INTRODUCTION

Willowbrook is a large, comprehensive high school of approximately 3200 students. It is located fifteen miles west of metropolitan Chicago, and it is one of three high schools in District 88. Approximately 60% of Willowbrook's graduates attend two and four-year colleges, and the remainder enters the local job market. The school, therefore, places a strong emphasis on trade, technical, and business courses as well as on its college preparatory curriculum.

The Guidance staff consists of eleven full-time counselors, including the Director, and a half-time psychologist. An increasing effort is being made to get vocational information to the students in a variety of ways and to acquaint both the counseling staff and the students with the excellent local job opportunities. We recognize that helping students make a good and successful vocational choice is one of the most difficult and complex facets of our work.

The project which will be described in the remainder of this report is designed to use computer technology as a tool to do a better job of systemetizing, retrieving, and applying masses of information for the purpose of helping the student make better-informed career and educational choices. The masses of information that will be harnessed are student personal data, occupational briefs, college information, trade-technical school-apprenticeship data, and local job opportunities. The system should be viewed as an automated library of information rather than as a decision-making mechanism. The system is also intended to provide for the student a model for decision-making which can be applied later in life. There is no intent to replace the counselor or to take away the personal touch. Rather the intent is to make accurate, updated, organized information readily available for human, professional consideration.

The major goals of the Project Committee are as follows:

1. To present to students expanded horizons of occupational possibilities.
2. To teach students valid methods of making decisions about vocational and educational choices.
3. To aid students to choose out of the vast number of possibilities those areas of work which best fit their abilities and interest.
4. To do the above in a unique way which will capture and hold student attention by developing personal involvement.
5. To make occupational information, including training opportunities, readily available to counseling and teaching staff.
6. To provide research data on factors involved in vocational decisions and job satisfaction.
7. To provide information about the range of local job opportunities.

II THE CLASSIFICATION OF OCCUPATIONS

After consideration of numerous systems of job classification, the Committee decided to use the two-dimensional classification system developed by Dr. Anne Roe, formerly of Harvard Graduate School of Education, and explained in her book *The Psychology of Occupations* (John Wiley & Sons: New York, 1956). Roe's classification divided occupations into six levels by amount of training required and degree of responsibility assumed by the worker. Briefly, the six levels are as follows:

Level 1: **Professional and Managerial 1.** This level requires high-level policy-making decisions and independent, varied responsibilities. If education is a relevant factor, it is at the doctoral level or equivalent.

Level 2: **Professional and Managerial 2.** The distinction between this level and the above is one of degree. These jobs may have autonomy, but the responsibility is less than in Level 1. These occupations normally require policy interpretation and education at or above the bachelor level, but below the doctoral.

Level 3: **Semi-Professional and Small Business.** These jobs have a low degree of responsibility for other people and application of policy or determination for self only. Education is normally high school plus technical school or the equivalent.

Level 4: **Skilled.** This and the following levels are classic subdivisions. Skilled occupations require apprenticeships or other special training experience.

Level 5: **Semi-skilled.** These occupations require some training and experience but markedly less than the occupations in Level 4. In addition, there is much less autonomy and initiative permitted in these occupations.

Level 6: **Unskilled.** These occupations require no special training or education and not much more ability than is needed to follow simple directions and to engage in simple repetitive actions.

Further, Roe divided occupations into eight categories of interest which are to some extent contiguously arranged. The eight interest categories are as follows:

1. **Service.** These occupations are primarily concerned with serving and attending to the personal tastes, needs, and welfare of other persons. Included are occupations in guidance, social work, domestic and protective services.

2. **Business Contact.** These occupations are primarily concerned with the face-to-face sale of commodities, investments, real estate, and services. Also included are such occupations as demonstrator, auctioneer, and some kinds of agents. A distinction is made in sales occupations between those in which the job is personal persuasion, which belong here, and those in which the selling is routine, and the person-to-person relation relatively unimportant, which belong in the next group.

3. **Organization.** These are the managerial and white collar jobs in business, industry, and government, the occupations concerned primarily with the organization and efficient functioning of commercial enterprises, and of government activities.

4. **Technology.** This group includes occupations concerned with the production, maintenance, and transportation of commodities and utilities. Here are occupations in engineering, crafts (including repair work), and the machine trades, as well as transportation and communication. Whether a physical scientist belongs in this group or in group 6 depends upon the setting in which he is working.

5. **Outdoor.** This group includes agricultural, fishery, forestry, mining and kindred occupations: the occupations primarily concerned with the cultivation, preservation and gathering of crops, of marine or inland water resources, of forest products, and other natural resources, and with animal husbandry.

6. **Science.** These are the occupations primarily concerned with scientific theory and its application under specified circumstances, other than technology.

7. **General Cultural.** These occupations are primarily concerned with the preservation and transmission of the general cultural heritage. The group embraces occupations concerning the subject usually called the humanities in college catalogues, but is broader than these. It includes occupations in education, journalism, jurisprudence, the ministry, linguistics, and so on. All elementary and high school teachers are included in this group. At higher levels teachers of science and art are placed in Groups 6 and 8.

8. **Arts and Entertainment.** These occupations include those primarily concerned with the use of special skills in the creative arts and in the field of entertainment. Both creators and performers are included.

At the time Roe published her book, she classified approximately 350 occupations in this way. In 1966, Dr. Roe and her associates at Harvard reworked the list of occupations in accordance with the new *Dictionary of Occupational Titles*, and the new list consists of 650 occupations. An example of the classification system follows:

LEVEL	SERVICE	BUSINESS CONTACT	ORGANIZATION	TECHNOLOGY	OUTDOOR	SCIENCE	GENERAL CULTURAL	ARTS & ENTERTAINMENT
I	PSYCHIATRIST PSYCHOLOGIST					ANTHROPOLOGIST OCEANOGRAPHER	ECONOMIST LAWYER	ARCHITECT
II	SOCIAL WORKERS COUNSELORS	PUBLIC RELATIONS WORKER	HOSPITAL ADMINISTRATOR, C.P.A.	AIRPLANE PILOT ENGINEER	SURVEYOR, LANDSCAPE ARCHITECT	NURSES, R.N. PHARMACISTS	CLERGYMEN, TEACHERS, H.S. & ELEM.	ACTOR ACTRESS DESIGNER
III	POLICE CHIEF, RECREATION WORKER	SALES, AUTO, INSURANCE	HOTEL MANAGER, STENOGRAPHER	DRAFTSMAN, FLIGHT ENGINEER	FOREST RANGER, COUNTY AGENT	DENTAL HYGIENIST, X-RAY TECHNICIAN	RADIO ANNOUNCER, T-V ANNOUNCER	INTERIOR DECORATOR, PHOTOGRAPHER
IV	POLICEMEN, PRACTICAL NURSES	DRIVER-SALESMAN	BOOKKEEPER SALESCLERKS	ELECTRICIAN JEWELER	FORESTRY TECHNICIAN, MINER	LAB TECHNICIAN, OPTICIAN		LETTERER, PASTE-UP MAN
V	TAXI DRIVER, WAITER		TYPISTS, CASHIERS	TRUCK DRIVER PLASTERER	CHAINMAN, RODMAN			
VI	ORDERLY, BELLMAN		MAIL MACHINE OPERATOR, SORTING MACH. OP.	BULLDOZER OPERATOR, CEMENT MASON	ROUSTABOUT, LUMBERJACK			PINBOY

III RELATIONSHIP OF THE STUDENT RECORD

Given this two-dimensional classification system, the Willowbrook Committee began to study the ways in which objective data available about every student could be related to it. It was decided to put student permanent records in computer storage, so that parts of the record can be used in helping a student make realistic vocational choices. In beginning operation, the committee decided to make use of cumulative class rank, composite score on a battery of tests, and an interest inventory, possibly the Kuder Preference Record. After data are gathered over years of experience, other items on the student record, such as grades in specific courses and personality ratings, may be used. The battery of tests which will be administered to sophomores yields a verbal and non-verbal ability score and six achievement scores (mathematics, science, reading, English, Social Studies, Solving Everyday Problems). The relationship of data to Roe's six levels will be as follows:

CUMULATIVE RANK IN CLASS		1	2	3	4	5	6	7	8	COMPOSITE TEST BATTERY SCORE (%)
TOP ONE QUARTER	I									TOP QUARTILE (76-99%)
1ST-2ND QUARTER	II									1ST-2ND QUARTILE (51-99%)
2ND-3RD QUARTER	III									2ND-3RD QUARTILE (26-75%)
2ND-3RD QUARTER	IV									2ND-3RD QUARTILE (26-75%)
3RD QUARTER	V									3RD QUARTILE (26-50%)
4TH QUARTER	VI									4TH QUARTILE (1-25%)
KUDER		SOCIAL SERVICE	PERSUASIVE	CLERICAL COMPUTATIONAL	SCIENTIFIC MECHANICAL COMPUTATIONAL	OUTDOOR	SCIENTIFIC	LITERARY	ARTISTIC MUSICAL LITERARY	

The computer will be instructed to use the higher of the two criteria (rank or composite score) for its reactions, which will be explained later, in case of discrepancy. Should the test score be considerably higher than rank in class, the computer will call this to the attention of the student.

IV THE STUDENT EXPERIENCE

Before the student comes to the computer equipment, he will have orientation to the classification system in a vocational unit in sophomore English classes. The six levels of training will be described to him in detail. The meaning of the eight interest categories will be explained and supplemented by audio-visual aids and guest speakers.

Sophomores, juniors and seniors will be invited to use the computer system on a voluntary basis during their free time. The student terminals will consist of a cathode ray tube and an automatic typewriter. A third-generation computer system will allow as many as 16-20 such student terminals on one central processing unit.

When the student comes to this terminal equipment, he will first be asked to type in his student number. When he does so, the computer recalls for its use the student's permanent record. Messages to the student which should be kept by him will be typed to him on the typewriter, which types at 180 words per minute. The "conversation" will be flashed on the cathode ray tube, and the student will respond by selecting multiple choice answers.

CVIS

In order to acquaint the student with the use of the gadgetry, the computer will invite the student to a game of tic-tac-toe. It will then carry on a conversation with the student in which the following four questions are asked:

1. Choice of occupation is related to your ability to learn. How do you rate yourself on ability to do school work compared to the rest of your class?

   1. Top Quarter
   2. Second Quarter
   3. Third Quarter
   4. Bottom Quarter

Computer reaction to Question 1.

1. *Information in your record agrees with your self-rating.*

2. *Information in your record indicates that you are in the _____ quarter of your class at Willowbrook. You may wish to discuss this rating with your counselor. The computer will proceed on the basis of the information in your record.*

2. Grades in school are also related to your vocational choices. Think about your semester grades in all subjects since you entered Willowbrook, and indicate where you think you stand in relation to the rest of your class on grade average.

   1. Top Quarter
   2. Second Quarter
   3. Third Quarter.
   4. Bottom Quarter

Computer reaction to Question 2.

1. *Information in your record agrees with your self-rating.*

2. *Information in your record places you in the _____ quarter of your class based on your grade point average at the end of last semester. The computer will proceed on the basis of information stored in your record.*

3. You will enjoy your future job more if you are interested in it. The jobs we have stored in CVIS are divided into eight categories of interest. Based on your knowledge of yourself and interest inventories you have taken, please select the category in which you currently have the highest interest:

   1. Service
   2. Business contact
   3. Organization
   4. Technology
   5. Outdoor
   6. Science
   7. Cultural
   8. Arts and Entertainment

Computer reaction to Question 3.

1. *The results of the interest inventory which you have taken agree with your choice.*

2. *The interest inventory which you have taken indicates that your highest areas of interest are _____ , _____ , and _____ . You may, however, look at the occupations in the interest area which you just chose.*

4. Keeping in mind your abilities and interests, you must now make some decisions about your plans after high school. The kind of occupation you will be able to pursue depends largely upon the amount of education or training you are willing to get. Please indicate the category which best describes your present educational plans:

   1. No further training after high school.
   2. Some training (2-6 months) after high school.
   3. Trade school (6-18 months) or apprenticeship.
   4. Technical school (6-18 months) or junior college technical program (2 years)
   5. Four years of college.
   6. Advanced degrees beyond college.

Computer reaction to Question 4.

O.K. message: The level of education which you have chosen seems realistic in the light of your record.

Minor discrepancy: Your record indicates that you could undertake a higher level of education than you have chosen. You may wish to discuss this with your counselor. You may, however, look at the jobs in the category you have chosen.

OR

The level of education you have chosen may be quite difficult for you unless your grades begin to improve in high school. You may want to discuss this with your counselor. You may, however, look at the jobs in the category you have chosen.

Major discrepancy: Your choice isn't realistic in the light of your present record. Please see your counselor. After a conference with him or her you may use this system again.

The script for the computer "conversation" is longer than quoted here. The Project Director tested the script with a group of students and altered it in accordance with their reactions to it. The computer's reactions are based on the decision table below:

QUARTER	O.K.	MINOR DISCREPANCY	MAJOR DISCREPANCY
1	I & II	III & IV	V & VI
2	I, II, III	IV & V	VI
3	III, IV, V	II & VI	I
4	IV, V, VI	III	I & II

Once the student has made a selection of interest category and training level, the computer chooses a "box" of occupations for him. The number of occupations in that box varies from none to as many as one hundred fifteen. The typewriter types out this list of occupations for the student. At this point the student may choose to explore occupations on that list or to go back and make different decisions about interest and education, which will produce a new list for him. If he chooses to explore occupations on the list he has, he is asked to type in the number of the first occupation. As soon as he does so, a fifty word definition of the occupation flashes on the screen. He may then ask for further information about that same occupation, begin to explore another on his list, or go back and make different decisions about education and interest. If he chooses to request additional information about the same occupation, the typewriter types a 250-300 word description. The format of these descriptions will be standard, including job duties, training requirements, recommended high school courses, working conditions, beginning salary range, and employment outlook. At the end of each description, reference will be made to sources of further information. The fifty-word definitions will be those which appear in the *Encyclopedia of Careers*, published in 1967 by the J. G. Ferguson Publishing Company of Chicago. This same company is preparing the 300-word job descriptions for Willowbrook without charge.

The student may then continue this process as long as he has time and interest. After the student has used the system once, he will not again play the game of tic-tac-toe or go through the self-evaluation. Rather, the computer will respond, "The last time you used CVIS (Computerized Vocational Information System) you were exploring jobs in the area of Science (flashing list on the screen). Do you want to continue exploring this list, or do you wish to make different decisions about interest and training?" The student may also recall any single job description by typing in the code number of that occupation.

V FURTHER DEVELOPMENTS

In another phase of development other types of information will be stored in the data bank to be accessed by students in the same conversational mode. This information would be primarily intended for juniors and seniors. The following is a summary of plans for future developments:

For students exploring occupations in:	Computer System will provide:
Levels I & II	1. Decision-making conversations about college (cost, distance from home, size, major fields, control, etc.).
	2. List of suggested colleges for investigation, based on the above decisions, student record, and testing information.
	3. Sources of scholarship aid if needed, based on student record.
Levels III & IV	1. Information about technical programs in local College of Du Page.
	2. Information about trade and technical schools within 100 mile radius.
	3. Information about local apprenticeships.
Levels V & VI	1. Information about how to choose your first job – gaming approach.
	2. List of companies in Du Page County which hire high school graduates (or leavers) in the field of interest specified by the student.

VI COUNSELOR BENEFITS

By means of a terminal hook-up to the computer, counselors and other pupil personnel workers can have access to any information stored in the data bank. By typing in specified code numbers, the counselor can recall information about the 650 occupations, over 3000 colleges, scholarships, local technical and trade schools, local entry jobs, and any student's total school record. We are currently expanding our traditional student permanent record to include such items as health disabilities, discipline record, record of work skills and experience, and information about the student gained from one and five-year follow-up studies. The counselor will also be able to recall the path of decision-making followed by each of his counselees. Part of this student record will be printed out for transcripts and other purposes. Some blocks of it will never be printed out, and only designated professional personnel will have access to it.

Also the computer will print out for counselors daily a list of counselees who have received minor and major discrepancy messages on the system during that day.

VII EVALUATION AND RESEARCH

A block of computer storage space will be set aside for data which will provide evaluation of the project. Such data as the following will be stored:

1. The number of times a student makes different decisions about level of education and interest area during his high school career.

2. The number of minor and major discrepancy messages given.

3. The result of these messages, ie, do they cause students to move toward more realistic goals?

4. The last 10 occupations explored in depth by each student. This can be compared with results of one and five-year follow-up studies to see to what degree the system is helping students to choose an occupation.

5. The number of times each occupation is explored by students.

6. The number of times each student uses the system.

The Committee has given much thought to the inclusion of the kinds of data which will be needed for evaluation and research. A consultant will be engaged to design a plan for evaluation. The evaluation will include:

1. Student reaction questionnaire.
2. Student interviews.
3. Counselor reaction questionnaire.
4. Control group approach.
5. Short and long-term follow-up studies.

The Willowbrook Committee hopes to have its vocational information system ready for beginning operation with students in January, 1969. Additional programs for college, technical school, and job selection will be added for the school year 1969-70.

STERLING TOWNSHIP HIGH SCHOOL; ILLINOIS

A 3-year project at Sterling Township High School has the objective of producing a series of video programs of occupational opportunities in the community and surrounding areas. The videotaped programming is designed for use with students in grades 7 to 12. Tapes of workmen on their jobs, which demonstrate the various occupational processes and work opportunities, are transmitted to the students in the classroom through closed circuit television. The equipment to produce these programs includes: (1) two television cameras and mounts, (2) a mobile panel truck equipped with Conrac video and sound controls, a Miratel monitor, television accessories, and an Ampex videotape recorder, and (3) a television studio in the high school equipped with an Emcee MA 2500 transmitter and modulator. It is hoped that the project will have some success in motivating young people to stay in school and to think about and prepare themselves for their life's work. (PS)

VOCATIONAL GUIDANCE THROUGH VIDEOTAPING AND TELEVISION

Prepared by:
William J. Tonkin, Director
Research and Development

INTRODUCTION

Specialization on a massive scale has led to an extremely affluent American Society. Such an economy holds vast potential for opportunity or for disaster for American Youth. The opportunity for youth to realize their potentials and interests is the goal of vocational guidance and career planning.

Recognition by Sterling Township High School of the complexity of the problem of career planning, led to the formulation of a research study project in vocational guidance. In 1965, the resultant proposal was presented to and accepted by the Research Coordinating Unit, Office of the Superintendent of Schools, State of Illinois, Springfield, Illinois. The project is Vocational Guidance Through Television and Videotaping.

The unique factor of this project is that it combines vocational guidance with educational television facilities. Videotaping crews are mobilized to go into the working world, make tapes of workmen in the

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

T005251

performance of their jobs, demonstrating the various occupational processes and work opportunities. The videotapes are later transmitted to the student in the classroom through closed circuit television. It is hoped that television, a familiar and accepted friend of this generation, will bridge the communications' gap that seems to exist between youth and the working community.

RESPONSIBILITIES

As developers of this project, we are charged with the responsibility of producing, over a three year period, a series of video programs of occupational opportunities in this community and the surrounding areas. It is hoped that, through the vehicle of television, vocational information will be presented to a student early enough in his school career to help him see the value of staying in school in preparation for his life's vocation. Additionally, it is hoped that this vocational information will assist him in planning his school program effectively and will give him a first-hand experience of what to expect of an occupation.

One wonders how many students drop out of school because they can see no connection between school and real life. Through vocational information and guidance, it is hoped that the student will see that school is pertinent to life, that he can have a sense of pride in his vocational choice, whatever it may be.

Through these programs, the school anticipates assisting students to see where they can fit into our economy and our community, what jobs are and will be available in this area and in the nation as a whole. Our entire industrial system is being revised continuously. There is no place in today's society for those who have no skills.

STUDENTS INVOLVED

Our students are more than casually involved in the complex industrial system of the world of work. These students in just a few years are the employees in these industrial and business concerns. Are they being groomed for their place in society? We hope, through these videotaped programs, to assist in the preparation of these students to meet their specialization needs in our modern industrial society.

Our videotaped programming is geared to boys and girls in the seventh through the twelfth grades. Project findings have pointed out that vocational guidance should be started earlier than high school. Many seventh graders have been thinking about vocations and careers - this is the point in their lives that direction should be given to this thinking. It is our premise that a visual program of many vocational opportunities should be presented to the students through their secondary school years - programs to assist their thinking whatever their vocational interests may be.

This project is directed primarily at the great percentage of students who will not graduate from college, although vocational guidance is valuable to the student who one day will be a college graduate. For all students, whether they be terminal students, high school graduates, or college graduates, it is hoped that the vocational information and guidance will help them choose an occupation intelligently, not fall into a job in a 'happenstance' manner.

EFFECTIVE PROGRAMMING

Since these programs are not geared to a specific age or interest group, the effectiveness of the TV programs must be imaginative and attractive to hold the interest of the overall seven to twelve grade group. At the same time they must be educational and valid as far as the information is concerned. Programming is being scheduled to cover the many types of occupational choices for both girls and boys in meeting their needs and interests.

Videotapes of occupational opportunities can accomplish what no other single medium can do in explaining the facets of vocational guidance - even a personal visit to the business or industry. A tour of a business could possibly get the same information. But what industry or business would or could take the time to conduct many tours. The TV program is the answer to this problem. It can be a distillation of many visits and much investigation and research. Moreover, the information may be presented to several individuals at one time, and, being on tape, it can be repeated to many different groups.

EQUIPMENT INCLUDED

To produce these television programs certain items of equipment are required. Sterling Township High School is most fortunate in having the necessary equipment for this project. The following equipment which permits our personnel to travel to the industries and businesses for the videotaping processes includes, basically:

1. Two television cameras and mounts

2. A mobile panel truck equipped with Conrac video and sound controls, a Miratel monitor, the necessary television accessaries, and an Ampex videotape recorder.

In addition, this school district has a well equipped television studio in the high school available for the use of this project and an Emcee MA 2500 transmitter and modulator.

PROJECT'S MAJOR OBJECTIVES

Through the use of this equipment and with the assistance of the personnel at Sterling Township High School who have the desire to serve the vocational interests of these students, the five main objectives of this project may be attained.

The first of these objectives is to examine the effect that vocational counseling services have in retaining young people in formal school programs. Sterling Township High School secured the services of Dr. Marshall Sanborn, University of Wisconsin, as a consultant to attempt to determine identification factors contributing to the student dropout situation. It is hoped that through the identification of the dropout factors, an intensive guidance program, a concerted effort to establish meaningful programs for students, and positive vocational counseling services, the number of student dropouts will be minimized.

Secondly, the project personnel hope to evaluate the effectiveness of a vocational counseling program in retaining students who have returned to a formal school training program after having been a 'dropout'. We hope to determine, through the project, reasons for dropouts and possible ways of bringing them back into a learning situation.

Another important objective of the project is to institute a follow-up program covering the employment records, salaries, and employers' evaluation to determine if participants in vocational education can find employment and successfully remain and advance in the field for which training was received.

The fourth objective of the project is to bring vocational guidance services to all youths of school age. Recent research indicates that two out of three dropouts exit from school before most occupational and other guidance facets begin to function. The traditional school program is geared to the ability to read and comprehend what he reads. This is important in his fulfillment as an indivudal and his usefulness in society. But it is equally important that the student who is not talented academically live a meaningful and fruitful life. There

is a great need for guidance services and for the development of practical courses that will prepare these students. Further, it is significant to note that the non-intellectual good traits that are essential to the work world, such as cooperation, self-discipline, and dependability, can be fostered in a vocational guidance program.

Probably the major objective is the establishment of the demonstration and research center - the collection and dissemination of information pertaining to vocational guidance through closed circuit television and other media of communication. The students at Sterling Township High School have access to a variety of existing sources for vocational guidance right now: the guidance counselors at Sterling High School, the vocational guidance counselor in the Whiteside Area Vocational Center*, guidance materials in the school and public libraries, and current national, state and local economic and occupational information that is being gathered by the project staff. Adding television to this, as a communicative medium, the student may have the ultimate in vocation guidance sources. Television is certainly the 'display-window' portion of this project. The programs, in addition to being interesting and attractive, must be meaningful and, we hope, fruitful in demonstrating the world of work and its many aspects to the school student.

THE COMMUNITY'S PART

What part has the community taken in this project? Community resources have played and will continue to play a most important role in this project. Local industrial and business concerns have been very instrumental in helping to provide the television equipment. Further assistance will be gained by forming an advisory council to assist in determining the various areas and sequences of study, review the requirements of job descriptions, assist the project members in selecting the personnel to appear in the videotapes and to preview tapes for accuracies.

What should not be left unnoticed in the Community's role is their general interest in the project. An adult class is being organized to instruct interested individuals in both the production and teachnical phases of television. An area TV station has offered the services of its staff in this instruction phase. Following the study phase, the members of the class will serve as members on TV crews.

SUMMATION

In summary, Sterling Township High School felt the growing need for a

* The Whiteside Area Vocational Center is a vocational school serving eleven high schools in the Whiteside County area, State of Illinois. It is located with and administered by Sterling Township High School.

more intensive and extensive vocational guidance program. This need is incorporated in a project for a functional and feasible school vocational program with the establishment of a demonstration and research center for vocational guidance. The research phase included the examination and study for school students in preparation for their vocational opportunities. The demonstration phase is the medium of videotaping of vocational processes. Sterling Township High School is fortunate in having the educational television facilities available in order to execute the plans.

By the establishment of this demonstration and research center, it is hoped that the project will have some success in motivating young people to stay in school and to think about and prepare themselves for their life's work.

FOR OCCUPATIONAL EDUCATION

July 27, 1967

TO: Persons Concerned with Vocational, Industrial and Technical Education

FROM: Robert S. Seckendorf

This is an abstract prepared by the staff of the Bureau of Occupational Education Research (New York State's Research Coordinating Unit) from the report on New York State data in a nationwide study by the American Institute for Research in 1963: The Process and Product of T & I High School Level Vocational Education in the United States.

The New York State Education Department supported the writing of the New York State Report, prepared by Max U. Eninger of the Educational Systems Research Institute and completed in May 1967. The study was designed to direct the attention of administrators and teachers to the needs of graduates from our trade and technical courses in making adjustments to post high school experiences.

The abstract is meant to convey to the teacher, supervisor, and administrator the study's implications and interpretations for direct application to today's school environment in New York State. An abstract of the National study is available upon request.

Limited copies of the entire New York State report are available on a loan basis, by writing to the New York State Education Department, Bureau of Occupational Education Research, Albany, New York 12224.

SUMMARY OF FINDINGS

Influences on Course Selection

Compared with U. S. graduates, New York graduates are less influenced by job opportunities, friends, and teachers; more by counselors, books and magazines.

Where They Went After Graduation

Over the 3 study years, there is a decrease in the numbers going directly to work, an increase in the numbers going to college. It seems likely that the educational opportunities offered by the New York Junior College system have influenced the fact that proportionally twice as many New York vocational graduates attended a college directly after high school graduation.

Placement Time and Method of Obtaining First Job

The level of the economy appears to influence the time required to find a job. Both New York and U. S. figures indicate that vocational graduates get jobs more quickly than noncollege-bound academic graduates.

In methods used to obtain the first job, the top two categories for both New York and U. S. graduates were "help of relative or friend," and "help of school teacher."

Relatedness of First Job to Vocational Training; Adequacy of Training

The high percentage of graduates who enter neither the occupations they were trained for nor a highly related occupation, represents, in a sense, a loss of trained manpower. The problem is most acute in New York in the two extreme categories: the percentage going into the same occupation is less than a third of the graduates and decreasing; while the percentage going into completely unrelated occupations is more than a third and increasing.

Of the New York graduates who entered the occupation for which trained, 45 percent reported they were exceptionally well prepared and 48 percent said they were well prepared on the whole. Only 6.5 percent regarded themselves as poorly prepared.

Comparability of Tools, Equipment, Work Methods and Materials Between Training and Employment

Students seem readily able to overcome difficulties of unfamiliar methods and equipment.

Starting Hourly Earnings

New York starting hourly rates are consistently higher than U. S. rates. The general trend seems to be that vocational graduates have come from behind, caught up with, and surpassed the academic graduates.

Job Satisfaction

Vocational graduates for both New York and the U. S. are consistently more satisfied with their first job than academic graduates. The mean satisfaction for vocational graduates who entered the same or a highly related job was considerably higher than the mean for those who entered a slightly related or unrelated one.

Reason for Leaving First Job

The four principal reasons for leaving the first job were lack of work, better position, military service, and job dissatisfaction.

The Present Job: Two, Six, and Eleven Years Later

Of those who take their first job in the field for which trained, there is a gradual loss to unrelated occupations over the years. The loss exceeds the gain by those who enter the field after holding jobs in unrelated occupations.

Number of Jobs Held

Almost 80 percent of the 1953 graduates had held four or less than four fulltime jobs since graduation, and 24 percent had held only one fulltime job.

Employment Security

Vocational graduates as a group show a high level of employment security, especially considering the layoff potential of some of their occupations such as the building trades.

Geographic Mobility

Data imply that vocational education ought to base occupational course offerings primarily upon forecast of manpower requirements of the communities and the surrounding areas.

Adequacy of High School Skills Training

A smaller number of New York than U. S. graduates report a need for additional training in mathematics and communications skills. It is to be expected that with increased experience and responsibilities, graduates will feel a need for additional training. The percentage of 1953 graduates who indicate needs for additional training is greater than the percentage of 1958 and 1962 graduates.

Attitude Toward Former High School

The majority of graduates gave a rating of "good" or "excellent" to each of the ten factors. Some significant "poor" ratings are "help given to students to find jobs," "vocational counseling," and "general physical condition of school."

Kinds of Post High School Education

Relatively few vocational graduates continue with public or private vocational education. New York and U. S. data are essentially the same, except that the percentage of vocational graduates from New York who attend college (32.9 percent) is greater than that of U. S. graduates (20.2 percent).

Conclusion		13

I. INTRODUCTION

The national followup study of high school T & I vocational graduates set itself three objectives: (1) To describe the post high school educational and vocational experience of a group of T & I vocational course graduates from the classes of 1953, 1958, and 1962; (2) To compare vocational course graduates from comprehensive high schools with those from vocational high schools; (3) To compare vocational with academic course graduates in terms of relevant post high school occupational and nonoccupational variables.

The national study selected 100 schools from the 667 offering three or more trade and industrial vocational courses, in eight geographic regions of the U. S. The schools were distributed in enrollment among small (less than 500), medium (500-1500), and large (more than 1500). The participating high schools in New York State were: Saunders Trades and Technical High School in Yonkers, Mount Vernon High School in Mount Vernon, Philip Schuyler High School in Albany, Sewanhaka High School in Floral Park, Hutchinson-Central Technical High School in Buffalo, McKinley Vocational School in Buffalo, Linton High School in Schenectady, and William Grady Vocational High School in New York City.

In general, the New York sample is a close approximation of the structure of the national sample--the percentage of large-enrollment high schools is rather disproportionately large, but the 50-50 national split between vocational and comprehensive high schools is identical in New York.

Graduates from each participating school were chosen on the basis of available programs. Where the graduating classes were smaller than 50, all graduates were selected for the followup study; where they exceeded 50, a random sample of 50 graduates was selected. The study was limited to male graduates only.

All the schools were visited by the research team, and a questionnaire was developed and administered to graduates. Multiple contact procedures were followed to ensure a high percentage of returns. The 51.6 percent returns for New York was very slightly higher than the total national percentage. In New York, 363 vocational school graduates and 188 comprehensive school graduates returned the questionnaire.

II. INFLUENCES ON COURSE SELECTION

The most important influences on choice of vocational courses acknowledged by New York graduates are: job opportunities (36.2 percent); parents (29.1 percent); books and magazines (20.5 percent); school counselor (17.5 percent); friend of same age (15.6 percent); relative (13.8 percent); school teacher (12.4 percent). Compared with U. S. graduates, New York graduates are less influenced by job opportunities, friends and teachers; more by school counselors and books and magazines. Comparison of the 3 graduation years reveals that the influence of job opportunities, parents, teachers, counselors, books, and magazines is increasing. New York figures are generally consistent with U. S. figures. The 3-year percentages for influence of counselors in New York--9.3, 17.3, 21.7--show a slightly faster rate of increase as well as a higher general percentage than the national percentages (7.8, 10.7, 15.4).

As the single most important influence on the type of course selected, 19.9 percent of New York graduates named job opportunities, as compared with 26.8 percent of U. S. graduates. More New York graduates (10.4 percent) named school counselors than U. S. graduates (5.7 percent).

In New York 18.3 percent of the comprehensive school vocational graduates, but only 6.3 percent of vocational school graduates, acknowledged the school counselor as the most important source of influence on course

selection. Such a considerable difference suggests that serious attention should be given to the quality and effectiveness of vocational guidance in New York vocational schools. In New York as well as in the nation, academic graduates are substantially more influenced by counselors and parents than vocational graduates; vocational graduates are more influenced by job opportunities than academic graduates.

III. WHERE THEY WENT AFTER GRADUATION

For the combined New York graduating classes, 70.2 percent went directly to work after graduation, while 75.7 percent of U. S. graduates did so. In New York 17.4 percent of the graduates went directly to college, while only 9.4 percent of U. S. graduates did so. New York and national figures are comparable for the small numbers of graduates who went into military service (New York, 10.9 percent) or continued in a trade or technical school (New York, 1.5 percent). Over the 3 years, there is a suggestion of a decrease in the numbers going directly to work, an increase in the numbers going to college.

New York vocational students who attended college did not necessarily continue to a baccalaureate or even an associate degree. But it seems likely that the educational opportunities offered by the New York Junior College system have influenced the fact that proportionally twice as many New York vocational graduates attended a college directly after high school graduation.

IV. PLACEMENT TIME AND METHOD OF OBTAINING FIRST JOB

Of New York graduates from all 3 class years who went from school directly to a job, 70.1 percent obtained their first full-time job within one month of graduation. The mean time to obtain the job was 1.0, 2.3, and 1.6 months respectively for the graduates of 1953, 1958, and 1962.

The level of the economy appears to be an influence on the time required to find a job: the class of 1953, a boom year, required the shortest time; the class of 1958, a recession year, required the longest time. These New York findings are not significantly different from the national findings; but they do differ in the comparison of vocational graduates from comprehensive and vocational schools. While U. S. figures indicate that graduates from vocational schools find jobs in slightly less time than graduates from comprehensive schools, New York figures show the reverse. The small number of schools in the New York sample, however, suggests caution in accepting the difference in significant (difference in community job opportunities might account for it).

Both New York and U. S. figures indicate that vocational graduates from either kind of school get jobs faster than noncollege bound academic graduates--a mean of 1.7 months for New York vocational graduates, 2.8 months for New York academic graduates.

In methods used to obtain the first job, the top two categories for both New York and U. S. graduates were "help of relative or friend," and "help of school teacher." New York graduates used school placement services less (8.1 percent) than U. S. graduates (9.6 percent). More New York vocational graduates (32.2 percent) than comprehensive graduates (24.1 percent) acknowledged some form of placement help from school which may be accounted for by evidence that vocational school graduates are somewhat more likely to enter the occupation for which they were trained than comprehensive school graduates.

V. RELATEDNESS OF FIRST JOB TO VOCATIONAL TRAINING; ADEQUACY OF TRAINING

How many New York vocational graduates find their first full-time employment in the job for which their high school training prepared them?

Over the years, about 28 percent of New York graduates entered the same occupation for which trained, 18 percent entered a highly related occupation, 18 percent entered a slightly related occupation, and 36 percent entered a completely unrelated occupation. Moreover, the percentage who entered the same occupation decreased from 35.6 percent in 1953 to 25.3 percent in 1962, while the percentage who entered a completely unrelated occupation increased from 28.9 percent to 40 percent during the same period.

The high percentage of graduates who enter neither the occupations they were trained for nor even a highly related occupation, represents, in a sense, a loss of trained manpower. The problem is most acute in New York in the two extreme categories: the percentage going into the same occupation is less than a third of the graduates and decreasing; while the percentage going into completely unrelated occupations is more than a third and increasing.

The problem is easy to trace back into the high schools. The student who comes to realize that the trade he has selected is not what he is suited for, whether for reasons of ability or interest, is under considerable pressure to continue in the course selected. Schools tend to discourage switching from one course to another. Many parents are inclined to do the same. Even when these pressures are not present, there may be a reluctance to change to another course because change means leaving old classmates, starting all over again, admitting defeat, or other deterrents. For many who realize they have made the wrong choice, there is no solution but to continue in the course chosen until graduation. After that, they can always go into something else. So they may reason, and so many do. Under these circumstances, the extreme importance of careful course selection in the first place, and adequate vocational guidance toward that selection, become apparent.

In the comparisons between vocational graduates from vocational and comprehensive schools, the differences between graduates placed in slightly related or completely unrelated occupations are negligible. Almost 32 percent of graduates from vocational schools, but only 21 percent of graduates from comprehensive schools entered the occupation for which their high school training prepared them. It would appear, then, that though students in vocational schools may be less influenced by vocational guidance in the selection of courses than are their counterparts in comprehensive schools, yet the vocational school students are more likely to carry their vocational training into full-time employment. Mean relatedness scores show that in New York, vocational schools do slightly better than comprehensive schools in placing graduates into jobs related to training. U. S. scores concur. U. S. vocational schools did slightly better than New York vocational schools; U. S. comprehensive schools did slightly worse.

Of New York graduates who entered the occupation for which trained, 45 percent reported they were exceptionally well prepared; 48 percent said they were well prepared on the whole; and only 6.5 percent regarded themselves as poorly prepared. U. S. graduates had a slightly but consistently higher regard for the vocational training they had received.

VI. COMPARABILITY OF TOOLS, EQUIPMENT, WORK METHODS, AND MATERIALS BETWEEN TRAINING AND EMPLOYMENT

In this category, New York figures are in close agreement with U. S. figures.

About 50 percent of the New York combined graduates found the tools and equipment on their first job almost identical to what they had had in school. Forty percent reported there was little real difference. Only 11 percent felt there was a substantial difference; and of these, about 69 percent reported that it took from a few weeks to less than 3 months to learn or relearn what was so very different.

Work methods on the job were found to be almost identical to those used in school by 29 percent of the New York combined graduates. Forty-nine percent reported little real difference. About 22 percent said the work methods were very much different; but of these, about 63 percent claimed it took less than 3 months to learn the new procedures.

About 46 percent of the New York combined graduates found the work materials used on their first job almost identical to what they had had in school. Thirty-seven percent reported little real difference. Only 17 percent felt there was a substantial difference; and of these, 65 percent learned to make up the difference in less than 3 months.

Altogether, students seem to be easily able to overcome difficulties of unfamiliar methods and equipment.

VII. STARTING HOURLY EARNINGS

New York vocational school graduates start with slightly higher hourly earnings than vocational graduates from comprehensive schools. U. S. data agree except that New York starting hourly rates are consistently higher than U. S. rates. The comparison of vocational and academic graduates is difficult to interpret, since the 1958 recession affected starting rates. The general trend seems to be that vocational graduates have come from behind, caught up with, and surpassed the academic graduates. In 1953, vocational graduates started at a mean of $1.36 per hour; academic graduates at $1.42. In 1962, vocational graduates started at $1.60; academic graduates at $1.50.

The combined years' mean starting rate for vocational graduates who entered the same occupation for which trained or a highly related one ($1.40) was lower than the mean rate for those who entered a slightly related or unrelated occupation ($1.56). U. S. data show the same proportion. The 3-year differences of 21, 17, and 12 cents per hour in favor

of those who entered slightly related or unrelated jobs indicate that this gap is being closed.

VIII. JOB SATISFACTION

Graduates rated their job satisfaction on a four point scale: 4= very satisfied, 3= satisfied, 2= dissatisfied, and 1= very dissatisfied. There is no consistent or substantial difference in mean job satisfaction between the graduates of comprehensive and vocational schools in New York. U. S. results slightly favor the vocational schools, but the difference is probably not significant. Vocational graduates for both New York and the U. S. are consistently more satisfied with their first jobs than academic graduates. The mean satisfaction for vocational graduates who entered the same or highly related jobs was considerably higher than the mean for those who entered slightly related or unrelated ones. The satisfaction rating may be at least as important in long-range occupational success as starting hourly earnings. A graduate who is highly satisfied with his job over the years will work harder and progress faster than the graduate who may jump from job to job in search of one he can like, each time returning to an entry-level wage.

IX. REASON FOR LEAVING FIRST JOB

New York graduates reported four principal reasons for leaving the first job: lack of work, 23.7 percent; better position, 22.9 percent; military service, 16.2 percent; and job dissatisfaction, 15.4 percent. U. S. graduates reported the same four, with slight percentage variations.

X. THE PRESENT JOB: TWO, SIX AND ELEVEN YEARS LATER

About 98 percent of the 1953 New York graduates were employed at the time of this study. The percentage employed for other class years was lower because of the numbers in college or military service.

The percentage of New York graduates who held their present job in the field for which trained was: 1953--35 percent; 1958--35 percent; 1962--43 percent--figures closely approximating the U. S. ones. A higher percentage of vocational school graduates than comprehensive school graduates had their present job in the field for which trained. Of those who take their first job in the field for which trained, there is a gradual loss to unrelated occupations over the years. This loss exceeds the gain by those who enter the field after holding jobs in unrelated occupations.

The present hourly earnings of vocational school graduates at the time this survey was made were slightly higher than those from comprehensive schools. The present hourly earnings of all vocational graduates were higher than those of noncollege academic graduates. Vocational graduates in the field for which trained had higher earnings than those in unrelated fields.

The New York pattern is confirmed by national data.

XI. NUMBER OF JOBS HELD

The New York vocational graduates of 1953, 1958, and 1962 held a mean of 3.1, 2.5, and 2.0 jobs in the 11, 6, and 2 years they were out of school at the time the survey was made. Thus, almost 80 percent of the 1953 graduates had held four or less than four jobs since graduation, and 24 percent had held only one full-time job. The combined New York mean of 2.4 jobs agrees very closely with the combined U. S. mean.

XII. EMPLOYMENT SECURITY

The employment security measure expresses a graduate's total number of months of employment since leaving high school as a percentage of his total number of employable months. Excluded from the total employable months are those spent in military service, full-time school attendance, or incapacitating illness. Part-time jobs are converted to equivalent full-time months.

Allowance must be made for the fact that a recent graduate would have had a smaller total of employable months, and thus that any time of unemployment before securing a first job would weigh disproportionately in the calculation. Given this allowance, it can be said that vocational graduates as a group show a high level of employment security, especially considering the layoff potential of some of their occupations; e.g., building trades. Many vocational graduates, in fact, had more than 100 percent employment security by virtue of having held a second part-time job during much of their working history.

Comprehensive school vocational graduates had a 3 percent higher level of employment security than vocational school graduates. In all other findings for this section, New York and U. S. figures agreed; but in this they were reversed. This difference, however, may easily be attributable to the smallness of the New York sample.

New York vocational graduates are 2.7 percentage points higher in employment security than are New York academic graduates; U. S. vocational graduates are 4.1 percentage points higher.

XIII. GEOGRAPHIC MOBILITY

For the years 1953, 1958, and 1962, the percentages of New York vocational graduates who had never moved to a different city were 76.5, 84.4, and 93.1. This high degree of stability is slightly greater than the total U. S. samples. More than half of all moves made by New York graduates involve distances of less than 150 miles. These figures imply that vocational educators ought to base their occupational course offerings primarily upon forecasts of manpower requirements of their own communities and the surrounding areas.

XIV. ADEQUACY OF HIGH SCHOOL SKILLS TRAINING

Graduates were asked how much they had learned of nine basic occupationally related skills in high school. The categories were: (1) manual job skills, (2) practical job knowledge, (3) theoretical job knowledge, (4) mathematical skills, (5) communications skills, (6) reading and interpretive skills, (7) clerical skills, (8) personal relations skills, (9) supervisory skills. New York graduates reported that they had learned most of their skills in high schools, with the exception of clerical skills, personal relations skills, and supervisory skills, of which the great majority of graduates claimed to have learned "almost nothing" or "some, but not much" in high school. Compared with the other six, these skills are not normally emphasized in high school curricula, and so the figures are understandable. But 41.5 percent of New York graduates claim to have acquired similarly little of practical job knowledge in high school. Since these are the graduates working in the same occupation for which trained, or a highly related one, the high figure is significant. It suggests the need for a reassessment of the "practicality" of high school programs' practical job training.

In every category, the U. S. graduates attribute a greater amount of skill learning to their high schools. Graduates of vocational and comprehensive schools attribute about the same amount of skill acquisition to the high schools, in New York and on the national scale.

XV. NEED FOR ADDITIONAL SKILLS TRAINING

A need for additional training in the nine kinds of skills and knowledge was reported by the combined New York graduates, in percentages ranging from 47 to 65. All these graduates were employed in fields closely related to their high school training. For each class year, a smaller number of New York than U. S. graduates report a need for additional training in mathematics and communication skills.

In the interpretation of these data it should be remembered that high school vocational training aims primarily to develop entry-level occupational skills. It is to be expected that with increased experience and responsibilities, graduates will feel a need for additional training. The expectation is supported by evidence that the percentage of 1953 graduates who indicate needs for additional training is greater than the percentages of 1958 and 1962 graduates.

XVI. ATTITUDE TOWARD FORMER HIGH SCHOOL

All vocational graduates were asked to rate ten selected characteristics of their former schools. They were: (1) quality of instruction from shop instructors, (2) quality of instruction from academic teachers, (3) condition of shop facilities and equipment, (4) general physical condition of school, (5) vocational counseling given to students, (6) help given to students to find jobs, (7) opportunity for extra-curricular activities, (8) teacher's interest in student problems, (9) school's reputation in the community, (10) school's strictness in maintaining discipline.

The majority of graduates gave a rating of "good" or "excellent" to each of the ten factors. Some significant "poor" ratings are as follows: "help given students to find jobs"--27.8 percent; "vocational counseling"--24.1 percent; "general physical condition of school"--21.1 percent. Only 2.9 percent rated the quality of academic instruction as poor; and only 2 percent so rated the quality of shop instruction. This last, in fact, was rated good or excellent by over 85 percent of the graduates.

<u>In comparison with U. S. figures, New York schools were rated lower in (1) condition of shop facilities and equipment, (2) general physical condition of the school, (3) vocational counseling, (4) help given to students to find jobs, (5) teacher interest in student problems, (6) school's reputation in community, and (7) school's strictness in maintaining discipline</u>.

XVII. KINDS OF POST HIGH SCHOOL EDUCATION

Relatively few vocational graduates continue with public or private vocational education. The most frequently cited sources of post high school education for New York graduates are: Military specialist school (24.1 percent), 4-year college (16.9 percent), 2-year college (16.0 percent), company course (10.2 percent), and correspondence course (10.2 percent). New York and U. S. data are essentially the same, except that the percentage of vocational graduates from New York who attend college (32.9 percent) is greater than that of U. S. graduates (20.2 percent).

CONCLUSION

Any conclusions based upon the data presented in this report must be qualified by the realization that the study was not specifically tailored to New York State; thus there exists the possibility of error caused by an insufficient number of schools in the New York sample. The many areas in which New York and U. S. statistics are comparable in quantity or trend direction, however, suggest that implications may be drawn from the data with some confidence.

The importance of job opportunities as an acknowledged influence on course selection could be turned to advantage by vocational counselors in planning their programs of guidance. Up-to-date information about hiring needs of local businesses and industries should be a part of the counselor's preparation for conferences with students.

On the other hand, the large numbers of graduates who never work in the specific occupations for which their schools trained them, suggests a possible overemphasis on the needs of employers and an under emphasis on the needs of the student. No matter how much in demand a particular speciality may be, the student who does not want to work in it after graduation will have wasted his training.

The very small number of graduates who obtain their first jobs through school placement services says little for the success of these programs. Only about 8 percent of New York graduates said they had been helped by the placement services; while about 16 percent said they had been helped by a school teacher. Guidance personnel might do well to draw upon and coordinate the private resources of teachers in gathering information about job openings.

There is an odd discrepancy in the responses relating to curriculum and inschool job preparation. Large percentages of graduates working in the field for which they were trained claimed to have learned little or nothing in school of such things as practical job knowledge, clerical skills, and supervisory skills. However, when these same graduates were asked a general question about how well their vocational course had prepared them for work in their trade, 93 percent of them said either that they were "exceptionally well prepared," or "well prepared on the whole."

It would appear that graduates carry away with them from school an illusory general impression of good training and satisfactory preparation. However, when the graduates are forced to assess their training in terms of specific skills called for by working circumstances, they discover that the training is not adequate. In the planning and administration of vocational curricula, great care must be taken to prevent the curricula from becoming closed systems, complete and sufficient in themselves, and yet irrelevant or inapplicable to the practical job situations that must be encountered in the working world beyond the school doors.

The picture of New York State vocational courses drawn by this report offers information on the strong and weak aspects of the State's programs, and provides terms for comparison and evaluation of individual courses. Its findings should be useful to administrators, counselors, and teachers in these fields; and, through them, ultimately useful to the vocational student himself.

OFFICE OF EDUCATION

JUN 16 1965

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

ADULT EDUCATION

Kastner, Harold H. r.
Needed: Night Classes in the Day
(Adult Education, XIII, Spring, 1963, 6 pp., typed copy)

School Dropouts and the National Economy
(American School Board Journal, vol. 148,no.4, April 1964, pp. 11-14)

Ter Keurst, Arthur J.
Warrensburg Adult Education Project Emphasizes Learning
(School and Community, vol. 51, no. 3, Nov. 1964, pp. 18-19)

Ness, Milton, J.
Adults Without Diplomas: Helped by Appleton Plan
(Wisconsin Journal of Education, vol. 97, no. 9, pp. 17 & 24)

ADVISORY COMMITTEES

McGrath, James J. and Rosalind H. Solon
The Role of the Advisory Commission in the Accounting Curriculum for a Community College
(The Delta Pi Epsilon Journal, vol. VII, no. I, Nov. 1964, pp. 4-12)

AGING

Kent, Donald P.
Current Developments in Educational Programming for Older People
(School Board Journal, vol. 149, Sept. 1964, pp. 27 & 30)

New York State Joint Legislative Committee on Problems of Aging
Birthdays Don't Count
(Leg. Doc. no. 61, 1948, 326 pp., ppbk.)
Young at Any Age
(Leg. Doc. no. 12, 1950, 192 pp. ppbk.)
No Time to Grow Old
(Leg. Doc. no. 12, 1951, 316 pp., ppbk.)
Age is no Barrier
(Leg. Doc. no. 35, 1952, 171 pp., ppbk.)
Enriching the Years
(Leg. Doc. no. 32, 1953, 199 pp., ppbk.)
Growing with the Years
(Leg. Doc. no. 32, 1954, 159 pp., ppbk.)
Making the Years Count
(Leg. Doc. no. 32, 162 pp., ppbk.)
New Channels for the Golden Years
(Leg. Doc. no. 33, 1956, 151 pp., ppbk.)
Brightening the Senior Years
(Leg. Doc. no. 81, 1957, 139 pp., ppbk.)
Good News for Later Life
(Leg. Doc. no. 8, 1958, 169 pp., ppbk.)

New York State Department of Labor
Helping the Job Seeker: A New Technique
(Industrial Bulletin, vol. 43, no. 5, May 1964, pp. 2-4)

New York State Joint Legislative Committee on Problems of the Aging
The years Ahead - For the Elderly, 'Tomorrow is Now'
(Leg. Doc. no. 84, Albany, 1960, 51 pp., pam)

Programming of Technical Changes and Manpower Adjustments
(Conference of Employment Problems of Automation and Advanced Technology, International Institute for Labor Studies, July, 1964, 16 pp., mimeo.

Bassie, Lewis V.
Some Hidden Meanings of Automation
(In Quarterly Journal of Economics and Business, v. 4, no. 2, summer, 1964, pp. 43-53)

Bell, Daniel
The Post Industrial Society: A Speculative View of the United States in 1985 and Beyond. (Occasional paper, 1963, 48 pp., mimeo.)

Bergmann, Ralph H. and Phillip Cohen
Method of Studying the Social and Economic Effects of Automation
(Conference on Employment Problems, etc. 19 pp., mimeo.)

Bernstien, Merton C.
A Challange to Enterprise: How to Put Automation to Work Making Jobs
(In Challenge, v. 11, no. 10, October 1963, pp. 23-27)

Blum, Albert A.
America's Reactions to Technological Change and Automation: A Comparitive View
(In Management of Personnel Quarterly, v. 3, no. 3, fall 1964, pp. 12-16)

Clague, Ewan
Employment, Automation and Economics
(Address...before the Thirteenth International Conference of the Gottlieb Dultwaler Institute for Economic and Social Studies, Zurich, Switzerland, July 1964, 24 pp., mimeo.)

Cooney, Robert B.
Automation: The Impact on Jobs and People
(In A.F. of L.-C.I.O. American Federationalist, v. 71, no. 5, May 1964, pp. 3-8)

Day, Virgil B.
Automation, Employment and Unemployment
(Address...before the Great Decisions Public Affairs Forum, McLean County, Bloominton, Illinois, February 15, 1965, 31 pp., mimeo.)

Dunlop, John T. (ed.)
Automation and Technological Change
(American Assembly, Columbia University, Prentice Hall Inc., Englewood Cliffs, N.J., 1962, 186 pp.)

Elton, L.R.B.
Educational Goals for an Age of Advanced Technology
(Conference on Employment Problems, etc., 13 pp., mimeo.)

Hayes, A.J.
Automation, Employment and Unemployment
(Address...before the Great Decisions Public Affairs Forum, etc., February 15, 1965, 14 pp., mimeo.)

Helstein, Ralph and others
Jobs, Machines and People
(Center for the Study of Democratic Institutions, Fund for the Republic, Santa Barbara, California, 24 pp., pam.)

Holmberg, Per
The Relationship between Full Employment and Technological Change in Western Europe
(Conference on Employment Problems, etc., 20 pp., mimeo.)

Hoselitz, Bert F.
The Influence of Cultural Factors on Technological Change in Developing Economies
(Conference on Employment Problems, etc., 13 pp., mimeo.)

Indiana University, Division of Economic Research
Automation and Employment Trends
(The Indiana Motor Vehicle Industry, March 1963, 73 pp., mimeo.)

Jaffe, A.J. and Walter Adams
Educational Attainment and Modern Technology
(In The Statistical News, v. 16, no. iv, December 1964, 6 pp.)

Keezer, Dexter
A Technological Revolution: Research and Development; Its Impact on the Economy
(In Challenge, v. 11, no. 12, December 1963, pp. 7-10)

McDonald, J.C.
Impact and Implications of Office Automation
(Occasional Paper No. 1, Economic and Research Branch, Department of Labor, Ottowa, 35 pp., pam.)

Michael, Donald N.
Cybernation: The Silent Conquest
(Center for the Study of Democratic Institutions, etc., 1962, 48 pp., pam.)

Mitler, Eric J. and David Armstrong
The Influence of Advanced Technology on the Structure of Management Organization
(Conference on Employment Problems, etc. 19 pp., mimeo.)

Moos, S.
Automation and Employment
(In The Political Quarterly, v. 35, no. 1, January-March 1964, pp. 80-86)

Phillipson, Morris (ed.)
Automation: Implications for the Future
(Vintage Books, Random House, New York, 1962, 465 pp.)

Reuther, Walter P.
First Things First: An Occasional Paper on the Free Society
(Center for the Study of Democratic Institutions, etc., 1964 12 pp., pam.)

Seligman, Ben B.
Automation and the State
(In Commentary, v. 37, no. 6, June 1964, pp. 49-53)

Silberman, Charles E.
The Real News About Automation
(In Fortune Magazine, v. 71, no. 1, January 1965, pp. 124-127, 220-228)
What Hit the Teenager
(In Fortune Magazine, v. 71, no. 3, March 1965, pp. 130-133, 228-234)

Smith, Georgina M.
Office Automation and White Collar Employment
(Institute of Management and Labor Relations, Rutgers, the State University, Bulletin No. 6, 26 pp.)

Stettner, Leonora
Survey of Literature on Social and Economic Effects of Technological Change
(Conference on Employment Problems, etc., 35 pp., mimeo.)

Stoddard, Hope
Automation and the Musician
(In The Butcher Worker, v. 51, no. 3, April 1965, pp. 9-11, 32)

Sumiya, Mikio
The Advance of the Technology of Japan
(Conference on Employment Problems, etc. 11 pp., mimeo.)

Thurley, K.E.
Changing Technology and the Supervisor
(Conference on Employment Problems, etc., 25 pp., mimeo.)

Uphoff, Walter H. (ed.)
Economic, Political and Psychological Aspects
(Proceedings of a symposium on employment of the Employment Center for Labor Education and Research, University of Colorado, Denver, Colorado, May 22-23, 1964, 56 pp., mimeo.)

Vocational Educational Information System

Work is continuing on one of the major assignments of the Massachusetts Research Coordinating Unit, the establishment of VEIS-a Vocational Education Information System. As part of the Massachusetts Research and Development Division, the Research Coordinating Unit is assigned responsibility for the collection of data needed for federal reporting requirements in vocational education.

Fall enrollment data has been collected and plans are progressing for reporting this data through a special booklet. Computer programs are written and tested to make available to special vocational area supervisors state wide data for their areas. Further data will be taken from the report by Congressional Districts and forwarded to each Congressman to give him a complete and detailed picture of vocational education enrollments in his district.

Forms and directions have been written for the collection of vocational education teacher data.

A pilot program testing follow-up reporting instruments is nearly completed. Materials were mailed to representative schools and evaluations were requested. The directions now will be adjusted before final printing and distribution.

Financial reporting forms and guidelines are being prepared by the Accounting Staff of the Research and Development Division. These materials will be part of the forty regional training conferences conducted each spring for local school department office personnel.

Work permit report data is being collected from all the cities and towns to be reported to the United States Department of Labor, Bureau of Labor Standards.

Research Advisory Committees are being established in the following areas: Agriculture, Distribution, Vocational Guidance, Home Economics, Health, Office Occupations, Technical, and Trades and Industry.

Suggestions have been received for membership and contacts are being made. The first responsibilities of these committees will be to recommend areas of research and to establish priorities.

I B M School

The Research Coordinating Unit Director attended the I B M School Executives School in Poughkeepsie, New York in November.

United States Office of Education Representative Conference

Dr. Urwin Rowntree and Dr. Richard McCann of the United States Office of Education Regional Office in Boston conferred with several Massachusetts Research and Development and Research Coordinating Unit personnel. Of particular interest was a research institute, services of the Regional United States Office of Education, a research seminar and educational research for correctional institutions.

Graduate degree research papers

A special bulletin was mailed to all vocational schools inquiring about staff members who might be interested in working cooperatively with the Massachusetts Research Coordinating Unit. The Research Coordinating Unit is interested in

1. initiating vocational education studies
2. helping vocational educators with their studies for advanced degrees.

The memorandum suggested help that the Research Coordinating Unit and its Research and Development Division could give.

A number of school directors have responded and have met with Mr. Knox and one director with Mr. Richard McCann of the Regional United States Office of Education for Exploratory discussions.

The Advisory Council State Vocational Education Study work is continuing. Visits to vocational schools have started. The Research Coordinating Unit has worked on the survey instruments going to graduates, non-public vocational schools and to 2,500 selected industries in eleven areas of manufacturing.

Technical Schools and Community Colleges

A problem of concern in Massachusetts is what technical education shall be provided by the community colleges. Several conferences have been held and a working position paper is now being written by Dr. Fox of the Massachusetts Advisory Council in Education.

The Research Coordinating Unit participated in these conferences and recommended regional vocational technical representatives for these conferences.

Occupational Interest Survey

An occupational interest survey program is being developed by the Research Coordinating Unit staff. Several Committees and Regional Vocational School Supervisors-Directors are interested in using this. It will be designed to reflect present offerings in vocational schools and community colleges as well as areas of manpower needs in Massachusetts, etc..

Research Coordinating Unit Brochure

A two-color brochure giving the objectives and services of the Massachusetts Research Coordinating Unit and a Memorandum from Education Commissioner Owen B. Kiernan was mailed to all Superintendents of Schools, Vocational School Directors and Superintendent Directors and Research Coordinating Unit Directors.

A copy of this brochure and the cover letter is included with this report.

Thirty-day labor report bulletin

Arrangements have been made with Research Department Director, Miss Charlottee Meisner, of the Massachusetts Division of Employment Security to have mailed to all vocational school directors copies of the Division of Employment Security's quarterly report of job openings unfilled thirty days or longer. The first of these reports has already been received by the school directors.

A request has been sent to the Massachusetts Department of Employment Security concerning the development of a special manpower report in the areas of office occupations, distributive education and home economics to be sent to Massachusetts high schools.

Vocational Program Brochure

The Blue Hills Regional Vocational-Technical School, Mr. William Dwyer, Superintendent-Director, requested samples of public relations and information materials now in use in the various states. A bulletin was mailed to all Research Coordinating Unit Directors requesting samples of materials.

The response has been excellent and the materials delivered to Mr. Dwyer.

Summer Research Institute possibilities were explored with the Regional United States Office of Education and Dr. Dethy of Northeastern University. Because of funding allocations, this has now been postponed until next fall or winter.

Magazine articles have been suggested and published in the Massachusetts Teachers' Association Journal telling about the Research Coordinating Unit and about the state wide vocational education study.

Correctional Institutions

Directors of Research Coordinating Units in all states were asked for vocational education and other education research in the area of Correctional Institutions. The materials received in response to this request are being forwarded to Mr. Gerald O'Laughlin, Massachusetts Supervisor of Education for the Correctional Institutions.

Educational Research Information Center Vocational-Technical Education Clearinghouse information Accessibility Seminar

Notices and information about this December 2 and 3 Cleveland, Ohio, seminar were sent to all vocational school directors.

Materials and briefings

Nancy Atwood of the Massachusetts Executive Office for Administration and Finance and Patricia Allen of Elementary and Secondary Education of the State Department of Education were sent vocational education information materials and were given several briefings about vocational education.

Lexington Project

Mr. Knox, Research Coordinating Unit Director, participated in a meeting with a special ciitzens committee sanctioned by the Lexington School Committee to study and bring in recommendations concerning programs for non-college high school students.

Research projects in this area and other data was later referred to Mr. Eaton, Chairman of the committee.

Regional Vocational-Technical School Financial Data

Regional vocational-technical school financial data was supplied for a school planning committee. These data included operational costs for some schools and costs for schools in the planning stage.

Tool and Die-makers

Machine shop and tool and die-maker instructional program enrollments data were requested from several states for a study being done by Northeastern University.

University of Massachusetts Workshop

As part of a program presented to three-hundred school secretaries at the University of Massachusetts in October, the Research-Coordinating Unit Director discussed its reporting needs and was available to answer questions.

Near Future Plans

1. Publication and distribution of Massachusetts Vocational Education Enrollments.

2. Distribution of Fall Enrollments to Congressmen by Congressional Districts.

3. Distribution of collection of number of Vocational Education Teachers.

4. Distribution of Follow-up forms and guidelines to prepare school administrators for this report as of the October 15, 1968 status of enrollees completing program.

5. End of Year Enrollment forms and Guidelines. This should not be difficult because Fall Enrollment materials were purposely designed to be almost identical.

6. Evaluation of Follow-up Pilot responses, final design of forms and guidelines and distribution in preparation for next fall collection.

7. Public relations consultations with the Lynn Shoe School Director.

8. Distribution of Manpower Reports to high schools.

9. Conference with Dr. Schaefer and Mr. Hammond, President of Fitchburg State College, concerning vocational education teacher training.

10. Lexington non-college committee work.

11. Visits to 15-20 vocational schools as part of the vocational education study.

12. Greenfield is doing a vocational education planning study. The Research Coordinating Unit Director will be meeting with this study committee January 17 to present answers and ideas.

13. A news and information bulletin.

14. A summer education research institute as a cooperative venture between Northeastern University and Research and Development.

15. Occupational guidance conference in Manchester, New Hampshire, January 23 and 24.

16. National Conference on the Diffusion of Educational Ideas, Michigan State University, March 26, 27, 28.

Near Future Plans (cont'd)

17. Albany, New York, Research Coordinating Unit conference, February 27, 28.

18. Research Advisory Committees will be organized for each major vocational area and for vocational guidance. The first duties of these committees will be to define areas needing research and to set priorities for action.

19. Research and curriculum materials information dissemination system.

20. Information and guidance materials for the writing of research proposals.

Quarterly Technical Progress Report

OE Bureau of Research No. 6-2761 Grant No. OEG4-6-062761-2145

Period: October 1, 1967 - December 31, 1967

Date of submission: February 1, 1968

Name of institution: Community College System, University of Hawaii

Title of project: Hawaii Vocational Education Research Coordinating Unit

Names of project directors: Dr. Richard H. Kosaki/David R. Lynn

Introduction

The Hawaii Vocational Technical Education Research Coordinating Unit was established with a direct grant from the Bureau of Research, Division of Comprehensive and Vocational Education Research, June 27, 1966, under the Research Section 4(c) of the Vocational Education Act of 1963. The project was approved in the amount of $113,338 and covered the three (3) year period from June 27, 1966 through June 30, 1969, to pay part of the cost of the program authorized.

This Sixth Technical Progress Report lists highlights and major activities of the reporting period. However, most activities are of a continuing nature and many of these have been described in detail in previous reports.

1. Major activities

The highlights of major activities of this reporting period are as follows:

The Hawaii RCU undertook an "in-house" research project to provide data and information desired by the State Commission on Manpower and Full Employment. The Commission provided supplementary funds and support services in formulating and critiquing the study. This study titled, "A Survey of Educational Activities Within Business-Industry and Expectations Concerning Public Education" has been completed and the final report is in the process of being edited and reproduced.

The survey consisted of two phases: Phase I, on-site interviews with personnel and industrial relations officers of 23 selected firms known to be conducting in-plant training programs; Phase II, obtaining similar data from a larger sampling by a mail questionnaire. Respondents reported a total of 50,000 employees--16 percent of the State's labor force.

The findings are expected to provide supplementary data regarding vocational-technical education for the forthcoming legislative session.

Staff assisted in the planning and the developing of a plan for secondary vocational-technical education programs in the State by acting as resource persons to the Coordinating Committee mandated to develop "A State Master Plan for Vocational Education."

Representing the Hawaii RCU were David Lynn who served on the advisory committee and Samson Shigetomi who was a member of the operational staff. These persons brought into the discussions research findings and other related reports presently available locally through nationwide RCU activities.

Staffing was increased by the addition of the services of John Nothom, former director of the Honolulu Community College. Local funding provided the support for this staffing addition to the RCU. In addition to being a co-author to the Business-Industry Training Survey, Mr. Nothom has initiated surveys to provide data and information to improve articulation between secondary and post-secondary occupational education programs in the State.

Staff has continued probing and exploring significant problem areas to warrant proposal development for Small Project Research funding out of Region IX. The College of Education, Department of Educational Psychology, has worked cooperatively with the RCU in exploring proposal possibilities. One formal meeting was scheduled. Those attending included Donald Leton, Chairman, Department of Educational Psychology; Marvin Poyzer, Teacher Trainer, Vocational-Technical Education; Teruo Ihara, Director, Foreign Contracts Office; and David R. Lynn, Hawaii RCU. At this time, the possible role vocational-technical education in Hawaii could play in serving the economic needs and development of the Pacific Basin was explored.

There has been continuous effort to stimulate research and development by instructional staff. Efforts to date in this direction have not been effective. However, with the expansion of the community college system and the building of staff with more degree personnel, several with doctorates, it is expected that interest in research activity will increase.

2. Problems

Problems relating to the effectiveness of the RCU in the State of Hawaii have been discussed in previous quarterly progress reports. The Fourth Quarterly Progress Report in particular dealt with some of the inhibiting issues. These are basically concerned with the administrative structure of vocational education in the State and funding practices. The Fifth Legislative session of the State of Hawaii convening this spring may resolve some of these issues by establishing a new State Board for Vocational Education.

Under present circumstances, for the Hawaii RCU to be effective, a funding structure is needed and the staff endorses proposals emerging at the national level for providing the RCUs with some permanent 4(c) funding support for research and development at the local level.

There have been no major departures from the Proposal Plan.

3. Significant findings and events

Significant in the State this quarter was the preparation of "A State Master Plan for Vocational Education" in response to Senate Concurrent Resolution 43 adopted during the 1967 regular session of the Fourth Hawaii State Legislature. The Senate Concurrent Resolution mandated "A coordinating committee of the Board of Education and the Board of Regents of the University of Hawaii to develop a comprehensive State master plan for vocational education in close consultation with the Commission on Manpower and Full Employment and other agencies." The operational staff consisting of Theodore Ruhig (Commission on Manpower and Full Employment), Samson Shigetomi (University of Hawaii/

Community College System), and Irwin Tanaka (Department of Education) did the actual work in preparing the plan.

The plan is presently being edited and published and will serve as a resource guide to the Fifth Legislative Session convening February 21, 1968. The U. S. Office of Education, RCUs and other agencies are being provided copies by the Hawaii RCU.

The "Master Plan" supports and endorses the concept of the RCU and emphasizes the need for fiscal provisions for research and evaluation. The varied research problems suggested in the "Proceedings Report" of the joint Manpower-Vocational Education Research Seminar are included in the appendix of the "Master Plan." The Hawaii RCU was instrumental in the development of these research problem statements.

4. Dissemination activities

Dissemination of research reports and related material has been limited and selective. Although previous quarterly reports have indicated greater emphasis on this area, implementation activities have been meager because of limited staff.

Dissemination has been limited to the duplication or abstracting of pertinent materials for the information of those specifically concerned with the improvement and development of vocational-technical education programs in the State. Information has been, for the most part, directed to the Chamber of Commerce of Hawaii, Commission on Manpower and Full Employment, State Council for Vocational-Technical Education, University of Hawaii's College of Education, and to "key" vocational educators at the operating level.

Educators and others have been encouraged to draw upon the accumulation of research reports, pamphlets and other documents relating to vocational-technical education in the RCU resource library. Bibliography No. I was published early last year; Bibliography No. II was published in June; Bibliography III has been completed and will be released early this next quarter.

5. Capital equipment acquisitions

Acquired during the quarter with Federal funds was an IBM Selectric typewriter. This piece of equipment supplements the one existing electric typewriter of the RCU. The typewriter is being used in particular for the typing of reports and other documents which are then duplicated through the University reproduction services. The Selectric provides a variety of type sizes and styles for report preparation.

6. Forms

No forms were developed or used during the reporting period.

7. Other activities

The RCU maintains working relationships with several agencies, institutions and organizations which are concerned with employment, human resources and education.

The RCU director regularly attends meetings of the Hawaii Chamber of Commerce Occupational Education Committee; College of Education Vocational Teacher Education Committee; Community College Central Office Staff meetings.

Meetings of the State Commission on Manpower and Full Employment, Hawaii State Vocational Rehabilitation Plan and Advisory Committee, State Vocational Education Master Plan were other intermittent meetings attended.

The RCU director also served as resource person during the quarter as lecturer on vocational education curriculum classes scheduled by the College of Education.

The Hawaii RCU has provided other RCUs in the nationwide network with quarterly reports and other pertinent material developed during the quarter. Requests for information by other RCUs have been promptly answered and provided when possible.

8. Staff summary

The following is a staff status summary for the reporting period:

Name	Title	Funds Fed./Local	Period Employed	Percent of Time
R. H. Kosaki	Director	x	9/67-12/67	5%
D. R. Lynn	Director of Operations & Coordinator	x	9/67-12/67	100%
S. S. Shigetomi * (*Temporarily assigned to State Master Plan)				
J. W. Nothom	Research Assistant	x	9/67-12/67	100%
F. S. Kakazu	Stenographer	x	9/67-12/67	100%

9. Activities planned for the next reporting period

Request has been made for the services of Lawrence Zane, former occupational instructor at Honolulu Community College, who has recently completed his doctorate at the University of Maryland. It is anticipated that the request will be approved. Lawrence Zane will be assigned the specific task of report publication and other dissemination activities.

During the next quarter emphasis will be placed on the preparation of final reports of several projects completed during the last two quarters. These projects have been reported in previous quarterly reports and are "in-house" research projects of the Hawaii RCU. More specifically, priority will be given to the following:

Completion of final reports of the following projects:

"Survey of Training Activities of Business-Industry and Expectations for Public Education"

"Development of Single Concept 8 mm Film-Loops"

"Profile Study of Industrial Education Teachers in the State of Hawaii"

"Concepts of Career Field Held by 11th Grade Students"

Continue with efforts to identify a research and development project containing the necessary significance for Federal funding through Small Project Research out of the Region IX office.

Increase dissemination activity.

Continue with efforts to identify instructional staff with research interests and capabilities; and, encourage these persons to engage in limited action research contributing to the improvement of existing programs of vocational-technical education.

I. MAJOR ACTIVITIES AND ACCOMPLISHMENTS DURING THIS PERIOD

A. Statewide Recurring Manpower Survey

The staff of the Research Coordinating Unit has designed a yearly recurring manpower survey in New Mexico. The yellow pages of telephone directories were used to obtain the names and addresses of all business establishments in towns and cities with population of 2,000 or over. The survey for the year 1967 has been completed in all but two cities, and the major portion of the data has been processed by the Statistical Division of the State Department of Education. The staff will start publishing a report as soon as the data is received from the remaining two cities. Payments to coordinators conducting the survey total $4,092.05 during this reporting period.

B. A Survey to Determine Priorities of Activities of Vocational-Agriculture Teachers

This survey, described in earlier progress reports, was completed on January 9, 1968. The study revealed sufficient differences existing between priorities of activities in the instructional areas to cause concern between the agricultural education program and the administrators interviewed. Additional in-depth research was recommended. Data was compiled by the staff of the Research Coordinating Unit.

C. Designing Education for the Future

The Research Coordinating Unit is funding six positon papers to be used by the Eight-State Designing Education for the Future Project. These papers should be completed in the late summer of 1968 at a total cost of $600. The papers will be forwarded to Dr. William Runge, Professor of Education, University of New Mexico, for the purpose of extracting excerpts to include in the State Plan for Vocational Education.

D. ERIC

The Research Coordinating Unit has continued its policy of encouraging the expanded use of its microfiche library. The staff has stimulated interest in this available research in several public schools and colleges. The staff has also cooperated with the Instructional Division of the State Department of Education in disseminating information on the microfiche library to public school personnel.

E. Development of Area Vocational Schools

The staff has been working with various committees in San Juan County in New Mexico in projecting an area vocational school. The Director has been working with the planning committee and

with the curriculum committee. Definite plans for an area vocational school should be complete with the next month and ready for presentation to the New Mexico State Board of Education.

The El Rito Area Vocational School has been expanded to include Rio Arriba County; the branch area vocational school will be located at Espanola, New Mexico. The State Legislature appropriated $190,000 for buildings and equipment for the Espanola Branch of El Rito. The Department of Economic Development has allocated approximately $800,000 to match the legislative appropriation.

F. State Plan for Vocational Education

The Unit is in the process of collecting data for the purpose of writing a state plan for vocational education. This report will concern itself mainly with post-secondary vocational education and, more particularly, with the location of area vocational schools in New Mexico.

G. Post-Secondary Vocational Student Follow-up

During the reporting period, the Research Coordinating Unit initiated and funded follow-up studies of persons graduating from vocational training programs at the following vocational schools:

1. Hobbs Junior College, Hobbs, New Mexico - Cost $42.00
2. Roswell Campus, Eastern New Mexico University, Roswell, New Mexico - Cost $150.00
3. Albuquerque Technical-Vocational Institute, Albuquerque, New Mexico - Cost $2,070.00

H. Mobile Laboratories

An experimental mobile instructional facility for engineering technology project, initiated by Louis W. Kleine at New Mexico State University, ended January 31, 1968. The final report on this project will be disseminated by the end of March.

The same bus and equipment that was used in the Kleine project at NMSU has been refitted and is being used as a mobile laboratory for teaching basic electricity and electronics at two remote rural school districts, Mosquero and Roy, New Mexico. The Department of Vocational Education and the Research Coordinating Unit cooperated with Superintendent Perrin and Superintendent Riddle of Mosquero and Roy in initiating the project. Twenty-four high school students are enrolled in these courses. This project is a cooperative effort between the Vocational Education Division and Simpson Educational Systems, Inc.

I. Waitress and Food Handling Occupational Training Program

The Waitress and Food Handling Project at Rio Grande High School has been completed under the direction of Mrs. Jan Dillon, Home Economics Instructor. The purpose of the study was to determine the value of the food handling project, both to the student and to the employer. Cost of the project was $2,459.55.

J. Summer Workshop for Vocational Teachers

A summer training program for teachers of office occupations will be conducted at Eastern New Mexico University, July 7 through July 20, 1968. The objectives of the training program will be:

1. To educate and orient instructors who will be teaching the simulated office program next year for the first time.
2. To develop guides for simulated office occupations with a workable plan for their first year of teaching the simulated method.
3. To provide teachers of office occupations with a workable plan for their first year of teaching the simulated method.
4. To create an awareness in the teachers of research in office occupations and of the importance of research.
5. To create an understanding by the teachers of the need for office occupations education.
6. To provide the teachers with an understanding of the simulated method, work experience, and cooperative education.

The Research Coordinating Unit worked with Mr. Elmer Schick of the U. S. Office of Education in Dallas and Dr. Becky Sharp of Eastern New Mexico University in initiating this project.

K. Proposed Research Project

A proposal was submitted to the Research Coordinating Unit for a study of the comparison of basic beliefs of Distributive Education Coordinators and Office Education Coordinators in New Mexico. The Evaluation Committee for Vocational Research reviewed this project and concluded that the proposal would not be of sufficient benefit to vocational education to justify funding.

II. PROBLEMS

The staff of the Research Coordinating Unit has determined that if the Statewide Manpower Survey is to be a continuing project, significant changes need to be made in procedures and personnel. The instrument used would need to be altered to remedy the diversity that became

apparent while processing the questionnaires. Additional problems were encountered in conducting the survey.

Funds for research were committed too early in the fiscal year; therefore, the research committee were unable to fund projects that were conceived in the latter part of the fiscal year. This may cause qualified researchers, colleges and universities, and public schools to lose interest in research in the future.

III. SIGNIFICANT FINDINGS AND EVENTS

The results of the particular studies funded by the Unit were published in the individual project reports.

IV. DISSEMINATION ACTIVITIES

A. Copies of the quarterly progress report covering the period September 1, 1967, through November 30, 1967, were mailed to addresses on the regular mailing list of the Research Coordinating Unit. A report on a research project entitled, "Pre-Vocational Orientation in Vocational Education for Junior High School Students in New Mexico", which was previously reported as completed, was also disseminated.

B. Copies of newspaper publicity relative to Manpower Needs Survey are attached. See Appendix A.

C. A large volume of correspondence and requests for publications and research material was handled during the quarter.

V. CAPITAL EQUIPMENT ACQUISITIONS

None

VI. FORMS

None

VII. OTHER ACTIVITIES

The professional staff attended the following conferences during the reporting period:

A. December 11-12, 1967, Curriculum Committee, Area Vocational School, Farmington, New Mexico
B. January 11-12, 1968, Evaluation Team, Vocational Education, Gallup, New Mexico
C. February 5-8, 1968, Conferences on Manpower Survey, Hobbs, Lovington, and Clovis, New Mexico
D. February 12, 1968, Conference on Area Vocational School and Survey, Farmington, New Mexico
E. Conferences on Vocational Rehabilitation and State Plan for Vocational Education in Santa Fe and Albuquerque, New Mexico

VIII. STAFF SUMMARY

Name	Title or Function	Funds Federal	Funds Local	Period Employed	Percent of Time
Dr. Joel W. Price	Director,RCU	x		12/1/67-2/29/68	100%
W. J. Barnes, Jr.	Assistant	x		12/1/67-1/19/68	100%
Margaret A. Fegan	Secretary	x		12/1/67-2/29/68	100%
Barbara A. Thomas	Secretary	x		1/16/68-2/29/68	100%
Helen Maestas	Stenographer	x		12/1/67-2/29/68	100%

Consultants on individual studies paid as per project agreement shown in Section I above.

IX. FUTURE ACTIVITIES PLANNED FOR NEXT REPORTING PERIOD

A. Finalize work on the Statewide Manpower Needs Survey

B. Continue dissemination of ERIC Research

C. Continue study on the State Plan for Vocational Education

D. Further work on Development of Area Vocational Schools

E. New Mexico Designing Education for the Future Project

F. Tape Recorded Occupational Information

G. Home Economics Study

H. Survey of Female Vocational-Technical Education Students in Southeastern New Mexico

I. Hobbs Vocational Follow-up Study

New Studies Proposed:

A. The Assistant Director of the Research Coordinating Unit will compile information obtained from the follow-up studies conducted at the four area vocational schools in New Mexico and incorporate this into one complete report for the existing area vocational schools. This report, a comprehensive follow-up, will provide such information as salaries, area of mobility, employment in area of training, salary (before and after training), and number of promotions.

B. The Research Coordinating Unit is funding a Vocational-Technical Education Seminar to be held March 30, 1968, at New Mexico Junior College, Hobbs, New Mexico. The theme: "How can post-high school vocational-technical education serve the higher education needs of youth in our area?"

C. The publication entitled "Vocational-Technical Education in New Mexico" is being revised and updated to include current information on all area vocational schools in New Mexico. When the study has been completed, the publication will be reprinted and disseminated.

D. The Research Coordinating Unit is cooperating with the School of Education and Psychology at Eastern New Mexico University in submitting a proposal for study and research in the area of using typewriters for the teaching of reading in the elementary school.

MOBILE CLASSROOM: A converted military ambulance bus is taking vocational education to rural students in Roy and Mosquero high schools. The bus is equipped with electronics equipment and a driver-instructor, Harry Chase (center). The traveling lab is a joint project of the State Education Department, the school districts and Simpson Educations Systems Inc. 9

Page Four - The Raton Daily Range - Wednesday, Jan. 31, 1968

Mobile Classroom Helps Students In Electricity At Roy, Mosquero 9

SANTA FE — A classroom on wheels is not too common to New Mexico education, but it is an imprtant factor in a cooperative educational project being conducted by the Roy and Mosquero school systems, Simpson Educational Systems, Inc. and the Vocational Education division of the State Department of Education.

Basic electricity and electronics are being taught in a mobile classroom to 24 Mosquero and Roy High School students. This is an experimental project which will provide students in remote rural areas a chance to learn about electricity and electronics.

Each class day, the teacher, Harry Chase, holds a three-hour theory and laboratory session at the Mosquero High School. After lunch, he drives the mobile classroom (a reconditioned military ambulance bus) 19 miles to Roy High School for another three-hour afternoon session. This activity takes place each school day.

According to Lee Palmer, director of trade and industrial education for the Education Department, the mobile classroom provides educational opportunities for students who, under ordinary conditions, would not be able to study electricity and electronics

The bus also enables two school districts to have technical classes which they could not individually afford to provide for their students.

Although only 24 students are enrolled in the course this semester, this is a large enrollment for these two small schools and each class has an excellent teacher-pupil ratio of 1:12

Plans are being made to locate jobs for these students in Raton, Las Vegas, Santa Fe, Albuquerque and Trinidad, Colorado

*FOLLOWUP STUDIES; *DISTRIBUTIVE EDUCATION; HIGH SCHOOLS; STUDENT ATTITUDES; *GRADUATE SURVEYS; PROGRAM EVALUATION; EMPLOYMENT EXPERIENCE; EDUCATIONAL EXPERIENCES; QUESTIONNAIRES
VIRGINIA

This follow-up survey of high school distributive education graduates in 79 Virginia high schools was conducted in 1963 by questionnaire. From the total enrollment of 9,352 for the years 1957-61 the number of returns was 2,903 or 31.2 percent. The data obtained were compared with the results of four former surveys. Some of the findings were: (1) 1,921 of the 2,903 who returned questionnaires are working, (2) Of those working 84 percent are working full time, (3) 61 percent are working in distributive occupations, (4) The unemployment figure of one percent can be considered negligible, (5) Almost 54 percent of 1957-61 graduates are employed in the same establishments where they received their cooperative training, (6) More than 30 percent attended school beyond the high school level, (7) 33 percent left the field of distribution for which they were trained, and (8) Graduates' suggestions for improvement indicate the need for improved instruction. CAPSULE SUMMARY

This five-year follow-up survey has been made to assist in evaluating the effectiveness of the Distributive Education high school program in Virginia in terms of the job stability of former students, numbers of DE graduates who continue their education after high school, and the impact of the program in later years on graduates.

The survey, begun in late spring of 1963, was conducted by Distributive Education coordinators in seventy-nine Virginia high schools. Some coordinators were assisted by Distributive Education students as a part of the activities of the local chapter of the Distributive Education Clubs of America. The survey was directed by Vivien King Ely, Research and Training Consultant, School of Distribution, Richmond Professional Institute and represents responses from 2903 Distributive Education students who graduated between 1957 and 1961.

Some of the more interesting findings of the study:

A total of sixty-six per cent of DE graduates are employed in the labor force. Of those employed, eighty-four percent are working full time and sixteen per cent part-time.

Of the total working, 10.6 per cent are attending school and working part-time.

Over one-third of DE graduates are still employed by the organization where they received their high school cooperative training.

Retailing is employing a decreasing percentage of DE graduates, while the percentage employed permanently in service and wholesale agencies is steadily growing.

More than thirty per cent of Distributive Education graduates continue their education beyond high school.

More students who continue education beyond high school major in general business than in distribution.

One per cent of Distributive Education graduates are unemployed.

Sixty-one per cent of DE graduates are still employed in distribution.

Thirty-three per cent of DE graduates have left the field of distribution for other employment.

Sixty-eight per cent of DE graduates are conscious of benefits which they received from the course.

Three-fourths of the graduates recall their DE work experience with pleasure; sixty-five per cent recall classroom instruction pleasantly and almost half recall with pleasure the personal help of the DE coordinator.

Although forty-one per cent of the graduates made suggestions for various improvements, the suggestions were widely scattered, with less than ten per cent mentioning improved classroom instruction and all other suggestions totaling below six per cent.

I. INTRODUCTION

Virginia DE Follow-Up Surveys --- 1941 to 1961

Studies to determine the effectiveness of the high school Distributive Education cooperative program have been a part of the research efforts in Virginia since 1950. During this time a ten-year study, a five-year study and two one-year studies have been made.

A ten-year study made in 1950 covered the years from 1941 to 1950 and included questions to determine the present occupation of Distributive Education graduates, their employment history, reasons for change in store or position and training since graduation. The survey also recorded responses from coordinators concerning student and graduate placement and from merchants concerning employment practices in relation to Distributive Education graduates.

The five-year follow-up study for the years 1951-1955 and two subsequent one-year surveys in 1956 and 1957 used a different questionnaire from the ten-year study and surveyed only graduates who had completed one or two years of Distributive Education in high school. The same questionnaire was used for each of these three studies. It inquired about present occupation, type of position held, and nature of schooling, if presently enrolled.

High School Representation in Follow-Up Surveys

Table 1 below shows the extent to which these follow-up surveys have represented the Distributive Education enrollment in the state.

TABLE 1
Participation of Virginia High Schools in
Distributive Education Follow-up Surveys, 1941-1961

Year	Total Enrollment	Number High Schools Represented	Total DE Programs in State	Number of Returns	Percentage of Returns
1941-50	4736	31	34	815	17.2
1951-55	5733	31	59	1167	20.4
1956	1650	52	73	720	43.6
1957	1848	56	67	828	44.8
1957-61	9352	79	95	2903	31.2

Purposes of 1957-1961 Survey

The following are the primary purposes of this follow-up survey:

1. To discover the present occupation of high school students enrolled in Distributive Education between 1957 and 1961.
2. To determine to what extent these students have remained in distributive occupations.
3. To discover any noticeable changes from the pattern established in former state-wide follow-up studies.
4. To spot any weak links in the Distributive Education instructional program.

The survey was also concerned with several secondary purposes:

1. To determine the proportion of former Distributive Education students now holding supervisory positions.
2. To determine what proportion of Distributive Education students have remained in the same agency in which they were employed when enrolled in Distributive Education.
3. To discover how often these students have changed jobs since leaving high school.
4. To discover why some students left the field of Distributive Education.
5. To determine what proportion of the 1957-1961 Distributive Education students continued their education after high school.
6. To give former students the opportunity to express in their own words:
   a. The ways in which they think Distributive Education helped them.
   b. How in their opinion Distributive Education could have been of more value to them.

II. SUMMARY OF FINDINGS

EMPLOYMENT HIGH AMONG DE GRADUATES

FIGURE 1
Activities of 1957-1961 Distributive Education Graduates

Figure 1 shows the proportion of students engaged in each activity, as compared with the findings of each previous survey.

The column which shows the percentages by activity for 1957-1961 shows one category which was not determined in previous studies. The category accounts for 10.6 per cent of former students who are going to school and working part-time. If this figure were added to the percentage for the "working only" category, the per cent working would rise from 55.6 per cent to 66.2 per cent. If it were added to the "school only" category, this percentage would rise from 4.7 per cent to 15.3 per cent. In order to present a more accurate picture of a student's activities, a separate category "working and school" has been added to the column for the 1957-1961 survey.

An appreciable decrease in the number of former students serving in the armed forces is noted, from close to 20 per cent to 10.3 per

cent in 1957-1961, thus making more persons available for the labor market or for school. The "other" category includes housewives primarily, but also includes 46 students who are unemployed.

Profile of the Unemployed

A total of 46 former students, 2.2 per cent of the total returns, classified themselves as unemployed; but of this number, only 34, or 1.6 per cent, indicated that they are actively seeking employment. Of the 34 seeking employment, 13 were seeking work outside the field of distribution, including office, factory or mechanical work.

When the 13 persons not seeking employment in distribution are subtracted, an unemployment figure of 21, or 1 per cent of the total, is left.

Nature of Employment

Of the 1921 graduates working, 84 per cent are working full time and 16 per cent part time. The percentage of students working full time is 10 per cent below the same figure in the last five-year study. However, the percentage working part time has grown from 7 per cent in the 1951-1955 study to 16 per cent in this study. These figures emphasize that increasing numbers of Distributive Education students are continuing their education beyond high school -- a point which will be expanded later in this report.

OVER ONE-THIRD OF DE GRADUATES STILL EMPLOYED WITH FIRM WHERE THEY RECEIVED HIGH SCHOOL TRAINING

FIGURE 2
Employment of 1957-1961 Distributive Education Graduates in High School Training Agencies

The percentage of graduates working in the same establishments in which they received their high school cooperative training increased over all previous surveys. The percentage of 33.9 shown in Figure 2 is almost twice as large as the 19 per cent employed in the same agency in the 1951-1955 survey. This question was not asked in the 10 year survey.

OVER 60 PER CENT OF DE GRADUATES STILL EMPLOYED IN DISTRIBUTION

Figure 3 shows a majority of former students presently employed in distributive businesses. Sixty-one per cent of the respondents are employed in distributive organizations, more than six per cent higher than the percentage for the 1951-1955 survey. The fact that this figure for 1957-1961 is also higher than the 1956 and 1957 surveys made one year after the respondents left high school further emphasizes the trend.

FIGURE 3
Type of Organizations Employing 1957-1961 Distributive Education Graduates

PERMANENT PLACEMENT IN SERVICE AND WHOLESALE BUSINESSES INCREASING

Table 2 shows an increasing number of permanent placements in service and wholesale agencies and consequently, a decrease in the number finding permanent employment in retail jobs. The ten-year study did not classify distributive jobs by type, but the 1951-1955 survey showed 72 per cent employed in inside selling, 5.5 per cent in outside selling and 22.5 per cent in service selling. A look at the breakdown of these percentage figures for the 1951-1955 survey indicates that most of the 20 classified in outside selling were definitely retail salesmen. But even if the 5.5 per cent classified in outside selling in the 1951-1955 survey are left unclassified, the percentage changes are appreciable, as can be seen in Table 2.

TABLE 2
Types of Distributive Businesses Employing
1957-1961 Distributive Education Graduates

	1951-1955 Per Cent	1957-1961 Per Cent
Retail	72.0	54.3
Wholesale	----	8.3
Service	22.5	37.4
Unclassified	5.5	----

OTHER EMPLOYMENT FINDINGS

The 16 per cent who have moved into supervisory positions since leaving the high school Distributive Education program is exactly the same percentage as in the 1951-1955 survey.

The stability of the respondents is indicated by the fact that 41.7 per cent have held only one job since leaving high school and only 8 per cent have held more than two jobs.

Of the 963 (33 per cent) who have left the field of distribution for employment in another field, 16 per cent preferred other employment, 52 per cent preferred another field because it offered a better opportunity and 12.9 per cent left for all other reasons.

OVER THIRTY PER CENT OF DE GRADUATES CONTINUE THEIR EDUCATION BEYOND HIGH SCHOOL

Table 3 shows that a greater number of Distributive Education graduates are attending school beyond the high school level than in any previous study. Although the ten- year survey and the two five-year surveys were not uniform in the phrasing of the questions concerning post-high school education, all included at least one question related to the subject.

The ten-year study determined the number of graduates who were or had been enrolled in additional training or courses; the 1951-1955 survey determined the number enrolled in school at the time of the survey; and the 1957-1961 survey inquired both about present enrollment and about enrollment since leaving high school.

Table 3 shows the comparative findings of the three surveys:

TABLE 3
1957-1961 Distributive Education Graduates
Enrolled in School

	1941-1950 Per Cent	1951-1955 Per Cent	1957-1961 Per Cent
Presently Enrolled	9.0	7.0	11.5
Have Been Enrolled	12.6	---	19.2
Totals	21.6	7.0	30.7

Length of Enrollment

Neither of the previous surveys attempted to determine the length of post-high school enrollment. The 1957-1961 survey did attempt to determine the extent to which students pursue education after high school. In reading Figure 4, however, it must be realized that the percentages shown here would represent a minimum length of enrollment, since only the 1957 high school graduates would have had the opportunity to complete college when this survey was made.

In order for this part of the report to be completely accurate, therefore, it would be necessary to restudy the respondents' education

patterns in 1965. It is nevertheless true that of the 896 (30.7 per cent) who attended school after high school graduation, more than half have continued for one or more years.

FIGURE 4
Length of Post-High School Enrollment
for 1957-1961 Distributive Education Graduates
(896 Enrollees)

Type of School Attended

Figure 5 shows that almost half of those who continued their education after high school attended junior college or technical school, with 18.4 per cent of this number attending business college. Colleges most frequently attended are: Richmond Professional Institute - 7.6 per cent; Old Dominion - 4.6 per cent; Virginia Polytechnic Institute - 3.2 per cent; and the University of Virginia Extension - 3.1 per cent.

FIGURE 5
Type of School Attended
By 1957-1961 Distributive Education Graduates

Major Fields of Study

Figure 6 shows that most DE students who continue their education after high school are majoring in areas of study other than distribution.

FIGURE 6
Major Fields of Post-High School Study
For 1957-1961 Distributive Education Graduates

OTHER FINDINGS

Armed Forces and Homemaking

The number of DE graduates in the armed forces has declined from 20 per cent in the last five years to 11.4 per cent in the present study. Table 4 shows also that the percentage of women engaged only in the occupation of housewife has been steadily decreasing since the 1941-1951 survey.

TABLE 4
1957-1961 Distributive Education Graduates
Engaged in Other Activities

	1941-1950 Per Cent	1951-1955 Per Cent	1957-1961 Per Cent
Armed Forces	10.0	20.0	11.4
Homemaking	19.0	18.0	15.1
Totals	29.0	38.0	26.5

Marital Status

Figure 7 shows that of those responding to this question, 45.6 per cent are married. This figure is only slightly higher than the 44 per cent reported in the last five-year study and the 43 per cent reported in the ten-year survey.

FIGURE 7
Marital Status of 1957-1961 Distributive Education Graduates

GRADUATES ASKED TO RATE DE PROGRAM

Opinion Concerning Effectiveness of DE

In an effort to determine the graduates' estimate of the effectiveness of the Distributive Education program, respondents were asked to express their opinions freely in response to several evaluation questions.

It should be recognized that the information which the survey attempted to develop here is difficult to get at "fairly". The respondent tends to remember what he was "supposed to get out of the course" and not be a good judge of his own experience. On the other hand, the former student has brought to mind the Distributive Education experience at least one year after having completed it and should be able to determine whether he has been using the training or not. Therefore, what he believes he gained is likely to be among the outstanding benefits and if he gained nothing, he should be fairly sure of this fact by now.

How Distributive Education Helped Graduates

Since 551 respondents did not answer this question, it can be said

that 19 per cent of the students were not aware of the benefits of the course, or received little benefit. To this number should be added 46 respondents who replied that Distributive Education did not help them in any way. The addition of the two figures reveals that 31. 4 per cent of the students believe that they received little or no benefit from the course.

In the opinion of two-thirds of the students who benefitted in some way from the course, the objectives of Distributive Education are closely related to the benefits which most students receive. Figure 8 below shows a breakdown of student opinion. The figure represents 2370 responses, reflecting more than one answer from some respondents.

FIGURE 8
Benefits of Distributive Education
to 1957-1961 Graduates

The following quotations are expressions in the DE graduates' own words of ways in which Distributive Education helped them.

- "DE shaped my career, my personality, my self-confidence. It opened my eyes to the moving world around me and showed me what I could do in life. My studies, my work and my club activities did more for me than anything ever has."

- "It was a great help in putting competitive spirit in me. It helps to understand yourself and the business man."

•"I think I am a wiser consumer . . . "

•" . . . helped me develop into a useful as well as dependable worker . . . "

•" . . . taught me to be honest with the buyer . . . "

•" . . . I cannot think of any subject which could have helped me more . . . "

•" . . . placed me in a job where I was forced to meet people . . . helped me and countless other young people to start coming out of their shells and act like men. "

•" . . . I wouldn't have gone to college if I hadn't taken D. E. "

•" . . . Wonderful subject and experience never to be forgotten. "

•" . . . gave me that extra step needed to get ahead of the rest of the world. "

•" . . . More than anything else, it helped me to stand on my own two feet. "

•" . . . showed many the many varied opportunities in distribution that are open to young people who are willing to apply themselves. "

•"I learned better management of an income, how to deal with the problems of the public, how to develop my personality and how to become a more rounded individual. "

•" . . . opportunity to meet different situations and learn from experience how to handle them . . . "

•" . . . DE gives one a sort of "sneak preview" of a career in distribution. "

•" . . . I can better understand how our economic system works. "

Distributive Education Activities Recalled with Pleasure

Almost all respondents recall some phase of their Distributive Education experience pleasantly and Figure 9 shows that a large percentage

recall several activities with pleasure. It is worthy of note that almost half the students recall the personal help which they received from the coordinator and that half recall their participation in the Distributive Education Clubs of America with pleasure.

FIGURE 9
Activities Recalled with Pleasure
By 1957-1961 Distributive Education Graduates

How Distributive Education Could Have Been of More Value

21.5 per cent of the respondents replied that no improvement is needed in the Distributive Education course, and 30 per cent did not reply, but the suggestions of 51.7 per cent could be considered for making the training of more value to the students enrolled. The suggestions are grouped in Table 5 according to responsibility for such improvement.

TABLE 5
1957-1961 Distributive Education Graduate Suggestions for Improvement of Course
Grouped According to Responsibility for Improvement

	Per Cent	Per Cent
No response		48.3
No improvement needed		11.1
Coordinator's responsibility		
Classroom	9.7	
Work Experience	6.4	
Field Trips and Guest Speakers	2.8	
DECA Activities	2.0	
Improved Coordination	.9	21.8
Student's responsibility		
Accept opportunity to learn	10.0	
Taken more DE	3.1	
Continued in field	4.2	17.3
Other		
Better community acceptance	.5	
All other	.9	1.4
		99.9

On the next page Figure 10 shows the same information expressed graphically. This figure points out the relative insignificance of any one of the suggestions taken singly.

	Per Cent
No Response	48.3
Could Not Have Been of More Value	11.1
Could Have Been of More Value if:	
Student had taken the opportunity to learn	10.0
Classroom instruction had been better	9.7
Work experience had been better	6.4
Student had continued in the field	4.2
Student had taken more Distributive Education	3.1
There had been more field trips and guest speakers	2.8
DECA activities had been better	2.0
Coordination had been better	.9
Community acceptance had been better	.5
Other	.9
Total	99.9

FIGURE 10
1957-1961 Distributive Education Graduates' Suggestions for Improving the Value of the Course

III. CONCLUSIONS AND RECOMMENDATIONS

Purposes of the Survey

This five-year follow-up survey of 2093 high school Distributive Education graduates in 79 Virginia high schools was conducted during the summer and fall of 1963 to determine:

1. The percentage of Distributive Education students who remain in the field of distribution after high school graduation.

2. Noticeable changes in employment or post-high school educational patterns established in previous state-wide follow-up studies.

3. Any weak links in the Distributive Education instructional program.

Secondary purposes of this study included determining the stability of students in retaining employment in the firm which provided their high school cooperative training, and to discover why some graduates have left the field of distribution for employment elsewhere.

The survey also offered the opportunity to solicit the opinions of Distributive Education graduates concerning the values which they received from Distributive Education and indications as to how they believe the course could have been of more value to them.

The Methodology

Wherever information is gathered by questionnaire, all of those queried do not respond. This always brings up the question as to whether the entire group can be represented by only those who answered. The data obtained in this survey has been examined for bias by comparing the results with the findings of all former surveys, particularly the ten-year and the five-year studies which preceded this survey.

This comparison showed that the results of the studies do not vary greatly except to show gradual changes which can be verified in fields other than the field of distribution. This evidence has led to the conclusion that the total group of Distributive Education graduates does

not differ too greatly from those who returned the questionnaire.

Since the reliability of the findings can be increased through greater uniformity in conducting the survey, it is recommended that a standard annual follow-up report form be adopted which can be machine tabulated and that Distributive Education coordinators receive special instruction in the conducting of the survey and careful editing of the returns before tabulation.

The questionnaire, except for the changes noted in Appendix A, is the same one in use for similar follow-up surveys since 1951. Because of continuous use and appropriate modification, the questionnaire has become more suitable with each use.

There are certain revisions necessary, however, in order to adapt the questionnaire for machine tabulation and these changes should be incorporated before the next survey is conducted.

The Findings

The findings of this study give cause for pride in the contribution which Distributive Education is making to the students who enroll in it, and to the distributive businesses of Virginia. Some of the findings show the need for strengthening the Distributive Education program and this section records both the accolades for past accomplishments and the challenges for the future.

Full Time and Part-Time Employment Ratios

The total number of graduates working full time has varied only slightly during the past twenty-five years, but the number working part-time has grown steadily until the present survey shows a growth from seven per cent to 16 per cent. This growth in part-time employment reflects the increased number of graduates attending school and working part time.

Unemployment

The unemployment figure of one per cent can be considered negligible, since the unemployment figure for Virginia is three per cent and for the United States as a whole, slightly above five per cent.

Training Station Placement

Considerable progress has been made by coordinators in obtaining work-experience placements which are true training stations for future full-time employment. Almost thirty-four per cent of 1957-1961 graduates are employed in the same establishments where they received their cooperative training. This percentage figure has doubled in the past five years.

Careers in Distribution

It is likewise reason for pride that sixty-one per cent of these graduates have remained in the field of distribution -- a growth of 6 per cent in the past five years.

Graduates' Suggestions for Improvement

The suggestions for improvement in Distributive Education are worthy of note, because criticism at this point indicates, at least in part, the need for improved instruction. Even though most students recall their classroom and work experience with pleasure, a very small percentage do not do so and the effective coordinator will want to be aware of such dissatisfaction in the future and strive to make the course as profitable as possible for each student enrolled.

Education of Graduates

More than thirty per cent of DE graduates attend school beyond the high school level. In 1965, an additional study should be made of this same group of graduates to determine the length of this post-high school enrollment. By this time most students will have had time to complete a four-year college course if attending full time and a clearer picture can be shown of the extent of education beyond high school.

With the study showing that more and more students are attending college, emphasis on continuing education in distribution should not be overlooked in any program. It should be of concern that only 13 per cent of those who continue their education are majoring in distribution. This figure emphasizes the need for the coordinator to spend more time in showing the career possibilities in the field. Students who show

promise while enrolled in high school Distributive Education should be shown that the possibilities for advancement and satisfaction in distribution and Distributive Education are great.

Retailing - Wholesaling - Service Employment

Permanent employment in retailing for Distributive Education graduates has been declining in the past five years -- from seventy-two per cent of all employment in distribution to fifty-four per cent -- while service selling organizations now employ thirty-seven per cent of DE graduates as compared with twenty-two per cent five years ago. The wholesaling field is now employing eight per cent of the Distributive Education graduates in Virginia. These findings indicate that coordinators will want to interest more service and wholesaling organizations in providing cooperative training placements for students while they are enrolled in Distributive Education in high school.

Transfers to Other Fields

The discovery that thirty-three per cent of the 1957-1961 DE graduates have left the field of distribution for which they were trained gives reason for concentration by the coordinator on pointing out the career possibilities and opportunities for advancement in distribution. Many students will not become aware of their potential contribution to the field and the resulting benefits which are commonplace among successful distributors unless the coordinator assumes this responsibility.

Student Benefits

It is discouraging to find that one third of the students enrolled in Distributive Education can recall no particular benefit that they received from taking the course. This information should prompt the coordinator to expend extra effort in seeing that each student progresses as far as he is able. Perhaps an evaluation period at the end of the Distributive Education course would help students to crystallize in their minds just what progress they have made while enrolled.

Coordinator Performance

It is evident that for the most part Distributive Education coordinators are performing commendably and this performance is evidenced in the findings of this survey. It should be adequate compensation to be among that select group of coordinators -- almost fifty per cent -- whose personal help former students recall with pleasure. And it is a fitting goal toward which the remaining fifty per cent might well aspire.

Future Research

The results of this survey could serve as the basis for additional studies related to the improvement of instruction - the goal of every conscientious Distributive Education coordinator, supervisor and teacher-educator in Virginia.

Although the criticism of the instructional program was not widespread, additional study in this area might offer suggestions for strengthening the weaknesses. As long as any graduate feels that his time in a course was wasted, the instructor of that course should be concerned that future graduates not experience the same weaknesses.

Additional study concerning the post high school education of Distributive Education students is needed. This research should be designed to discover the extent of such study and the success of DE students enrolled in higher education.

IV. ACKNOWLEDGMENTS

This report would be incomplete without further acknowledgment of the assistance of Distributive Education coordinators and students who conscientiously performed the field work involved in this study.

The director is indebted for advice and editorial assistance to Louise Bernard, Lucy C. Crawford, Leonard F. Maiden and James Horan, Jr. of the Virginia State Distributive Education Staff; to Dr. Thomas C. Sanders of the Fifth Federal Reserve Bank and John D. Lambert of Richmond Professional Institute for critical reading and statistical advice; to Leroy M. Buckner of Richmond Professional Institute for serving as advisor, and to a number of students and graduate assistants who assisted in tabulation.

V. APPENDIX

Appendix A

SURVEY PROCEDURE

The names of students enrolled in each high school Distributive Education program for the five-year period under study were taken from the November 1 coordinator's Monthly Cooperative Report submitted to the State Distributive Education office. These lists of students were sent from the State office to the local high school coordinators. The coordinators were instructed to check their local records and to complete the follow-up survey cards (Appendix D) by entering each student's name, address and years enrolled in Distributive Education. These names and addresses were to be verified before mailing or delivering the questionnaire forms to the former students. Instructions were given for personal follow up on questionnaires not returned by June 7, 1963. Coordinators were urged to make individual efforts to secure missing responses during the summer months of 1963. Notations concerning efforts to follow-up questionnaire forms, corrected addresses and other pertinent information were entered on the appropriate survey cards. Each coordinator was instructed to return the completed questionnaires and the survey cards by November 1, 1963. Since past surveys have shown that ours is a mobile population, and that it is often difficult to locate a student who has been out of high school for more than 2 or 3 years, an effort was made to locate former students by telephone or personal visit before the follow-up questionnaire was sent to the student for completion. (Instructions to coordinators appear in Appendix E.)

The follow-up survey procedure was planned so that the local high school chapter of Distributive Education Clubs of America, if desirable, could be used to assist in the early stages of the follow-up survey. The DECA project was titled "DECA Operation Manhunt". Specific instructions (Appendixes F, G, H) were given for using teams of students, to be known as agents, working in each school under the supervision of student captains and a student colonel, in turn supervised by the local DE coordinator-club sponsor. Essentially the same procedure as that given above was suggested for the use of high school students. Clubs which participated in the "Operation Manhunt" project earned points toward honor club awards.

THE QUESTIONNAIRE

The questionnaire form used in the previous three Distributive Education follow-up surveys was used as a basis for developing the questionnaire for the 1957-1961 study (Appendix C). The following questions appear on the new form, which were not included in former follow-up surveys:

1. How many full-time jobs have you held since leaving high school?

2. What is the longest period during which you were employed in one organization since leaving high school?

3. If your present job is not in distribution, please tell why you left this field of employment.

4. Have you been in school since leaving high school? What was your major subject? What is the name of the school?

5. How did DE help you?

6. Which of the following DE activities did you find of most value?

DE classroom instruction	Guest speakers
DE work experience	Personal help of coordinator
DE club activities	Other
DE field trips	

7. How could your DE experience have been of more value to you?

Questions added to the questionnaire were approved by an advisory committee composed of the State Supervisor of Distributive Education, Area Supervisors and Teacher Educators.

Dear Former DE Student:

We are interested in you and want to know what you have been doing since you left the DE program. This questionnaire represents an effort to locate every DE student enrolled in Distributive Education in Virginia between 1957 and 1961.

We invite you to return to your former school and to participate in the DE Club alumni activities. The present members of DECA in this school would welcome a visit from you.

At this very moment, we urge you to take a few minutes to complete the form below and return it in the enclosed envelope. Your prompt reply will contribute to the success of this project.

We appreciate your cooperation and look forward to hearing from you.

Cordially yours,

_____
DE Coordinator

COORDINATOR CHECKLIST

DISTRIBUTIVE EDUCATION SERVICE
State Department of Education
Richmond 16, Virginia

CHECKLIST FOR CONDUCTING HIGH SCHOOL FOLLOW-UP SURVEY SPRING AND SUMMER, 1963

Check with your school administrator for approval of this activity. Division superintendents and principals received copies of Miss Bernard's April 22 memo.

1. Familiarize yourself with this and other pink forms establishing procedure for conducting the survey.

2. Study blue forms which include plan and sample forms for making this survey a club project.

3. Make a preliminary check of the OCTOBER COOPERATIVE REPORT for each of the survey years (1957-58 through 1961-62) during which DE has been in operation in your school, to determine the total number of students enrolled during this period.

4. Determine what method you wish to use in conducting the survey and make a planning calendar with deadline dates for completion of various phases of the survey. For example:

	Deadline Date
a. Preliminary completion of survey cards	May 15
b. Verification of survey card information	May 22
c. Questionnaire mailing	May 24
d. Questionnaire return	May 31
e. Follow up for late questionnaire return	June 7
f. Individual efforts to secure missing responses	June 10-July 15
g. Final check for completion and return of forms and notations on survey cards	July 22
h. Return questionnaires and survey cards to area supervisor	August 1

5. Present your proposed plan with deadline dates to your school administrator for approval.

6. By this time you will have received your pack of survey cards with names of students for each year entered from the October reports on file in the State office.

   Complete these survey cards, adding from your DE files the following items:

   a. Last known address and telephone number
   b. Last known name
   c. Town
   d. School
   e. Parent's name (WRITE IN THIS ITEM ON SURVEY CARD)

7. Verify and correct information on survey cards

   a. By telephoning number on survey card
   b. By telephoning parents
   c. By checking with relative, employer or friend

8. On back of survey card, make notation to indicate each effort made to determine present location of former student.

9. By May 23, you will have received your supply of questionnaire forms. After student is located, fill out questionnaire and mail or deliver the form to the former student for completion.

10. Enter date questionnaire sent on back of survey card.

11. Check one week after mailing to determine whether completed questionnaire has been returned and make entry on back of survey card.

12. Follow up by telephone, mail or personal call to secure completed questionnaire if not yet returned. Make note of this action on back of survey card.

13. Return completed questionnaire forms and all survey cards with notations of action on the back by AUGUST 1 to your area supervisor.

Appendix F

DECA PROJECT "OPERATION MANHUNT" CHECK SHEET

DISTRIBUTIVE EDUCATION SERVICE
State Department of Education
Richmond 16, Virginia

COORDINATOR'S CHECK SHEET FOR DECA PROJECT

"DECA OPERATION MANHUNT"
Spring 1963

1. Appoint or have your club members select the club members who will be the leaders in this operation.

   You will need:

   a. A COLONEL who will be the CHIEF AGENT in charge of overseeing and directing the entire project with the coordinator as advisor.

   b. Several team CAPTAINS or SPECIAL AGENTS, each to oversee and direct the activities of a small group of club members in getting the survey cards and questionnaires completed.

   c. Remainder of club membership will be AGENTS assigned to a specific team and responsible for following up a small number of survey cards and securing completed questionnaires.

2. Duplicate letter to DECA members.

3. On or about May 15, you will receive a package of cards containing the names of students enrolled in your program for each of the survey years. Each card will carry a number to assist you in keeping track of it and checking to see that all cards are returned to Richmond in August.

4. Schedule a meeting of the Colonel and Team Captains to divide survey cards equally and assign to teams.

5. Allow team captains to secure addresses, telephone numbers and parents' names from your records and enter such information, with name of school and town on each survey card.

   Be sure that the complete plan is understood and that each team captain realizes his responsibility for checking on his assigned team members (agents) regularly to see that they set their goals and complete the assignment quickly. If the project is allowed to drag, it will never be completed.

   Go over each step of the procedure and each form with the team captains.

   Copies of the Agent's Report Form will arrive around May 15. A sample of this form is included here to let you see what this form looks like.

6. Allow time for careful training in procedure and conduct with all student agents.

7. Check pink coordinator's checklist and set up a calendar for completion of each stage of "MANHUNT". Allow for regular team reports to entire membership to keep interest high.

8. Remember that this personal follow-up method by agents, with the help and guidance of captains, is essential. If the forms are just mailed out to the last address in the DE files, many will never be returned.

9. District contest awards will be based on percentage of completed questionnaires as well as on thoroughness of search for former students, as based on the agent's report forms.

10. Send agent report forms to your area supervisor by June 20, with a status report giving the following information about your survey:

    a. Number of survey cards declared "dead" (unable to reach).

    b. Number of questionnaire forms completed and returned.

    c. Number of questionnaire forms sent but not returned.

Appendix G

LETTER TO DECA CLUB MEMBERS FOR "OPERATION MANHUNT"

Dear DECA Members:

Between May 15 and the end of school in June, every DE Club in Virginia is invited to participate in "DECA OPERATION MANHUNT" -- an attempt to track down and communicate with every student who was enrolled in DE during the school years 1957-58 through 1961-62.

These former DE students can supply information to help the DE coordinators make DE more helpful to each student who takes it. These former DE'ers can be an excellent source of publicity for your local DECA chapter and many of them would like to work with you as alumni members.

You will be competing with other DECA chapters in your district for a cash award to be made to the club conducting the most successful "MANHUNT". Here is your opportunity to locate these former students and at the same time, earn project points and perhaps money for your club while making a significant contribution to DE in Virginia.

The procedure described below can serve as your operation check sheet, as well as a form to keep a record of your "MANHUNT" activities. This report form will be turned in to your coordinator according to the instructions given to you in your own club. It is important that you record every thing you do to locate a person because the final awards will be based on your efforts, as well as on how many returned questionnaires you secure.

PROCEDURE FOR DECA OPERATION MANHUNT

1. Your team captain will give you a number of survey cards containing names, addresses and telephone numbers of DE students enrolled in DE here since 1957-58.

2. You should first call the telephone number or go by the address to determine if the person is still living at the address which you have. If the name, address or telephone number has been changed, make the correction on the card which was given you, and list date and what you did on the back of the card.

3. If you cannot locate this person through the address in the coordinator's file then try one of the following methods to "get your man":

   a. Try to locate student through the parent, whose name has been written in on the card.

   b. Check coordinator or school records for the name of a relative who may know the whereabouts of the former student.

   c. Use the city directory and check with neighbors to secure a forwarding address for parent or student.

   d. When you have secured a correct address, make arrangements to interview student or to send him the survey form for his completion. Record this activity on your survey card.

   e. If possible, get a definite commitment from him to return the form to the coordinator by a certain date or to pick it up yourself. Be sure you keep the appointment, if you are to pick up the form.

   f. Indicate on the survey card whether the coordinator is to mail the form or to give it to you for personal delivery.

   g. Enter the student's name on your report form, and check the appropriate columns.

   h. When you have carried out the plan, complete the report form and return completed survey card to your team captain or coordinator.

4. If you locate a correct out of town address:

   a. Write the correct address on the survey card, write "MAIL SURVEY FORM" on the back of the card and return to your coordinator for mailing.

   b. Write this name on your survey card. Fill in the appropriate columns on your Agent's Report Form.

(Signed)_____

Colonel
Chief Agent for
"DECA OPERATION MANHUNT"

Appendix H

AGENT'S REPORT FORM FOR "DECA OPERATION MANHUNT"

Spring 1964

(DE High School Follow-Up Survey 1957-61)

School _____ Coordinator _____

Town _____ DECA Agent _____

Team Number _____ Team Captain _____

Complete the columns below by entering names of former DE students assigned to you from survey card and make checks on entries in appropriate columns to record each thing you do to locate this person and get a completed questionnaire form from him. THIS FORM SHOULD BE RETURNED TO AREA SUPERVISOR BY JUNE 20.

Name of Former DE Student	Years Enrolled in DE	Survey Card Number	Entered last known address & tel. no. on survey card. (Check mark in column when completed.)	Entered parents' name on survey card. (Check mark in column when completed.)	Calls or contacts made to verify address & tel. no. (Enter number of calls made.)	Entered correct address, name and tel. no. on survey card. (List date entered.)	Questionnaire delivered or mailed. (Indicate which.)	Questionnaire pick-up or follow-up date. (One week after delivery or mailing.)	Checked to determine whether completed questionnaire returned. (List date checked)	Followed up to secure return. (List dates followed-up.)	Questionnaire returned. (Enter date.)

*CONFERENCE REPORTS; *VOCATIONAL EDUCATION; OCCUPATIONAL GUIDANCE; EDUCATIONAL PHILOSOPHY; *SOCIAL CHANGE; SOCIAL PROBLEMS; *ADMINISTRATIVE PROBLEMS; *EDUCATIONAL COORDINATION; EDUCATIONAL PLANNING
*SOUTHEASTERN PENNSYLVANIA REGIONAL SEMINAR FOR SECONDARY PRINCIPALS AND COUNSELORS, JUNE 28-30, 1965

The conference was organized in response to the interests and needs of the region and to national and state re-examination of the role and functions of vocational education. Approximately 180 secondary administrators and counselors from 15 counties participated. The focus was on current and future challenges facing educational leadership. Four assumptions served as a framework for the conference: (1) Emerging scientific, technological, social, political, and economic conditions are changing the nature of life itself, (2) These conditions are to be understood and planned for in current educational programs, (3) Local, area, regional, and interstate planning will be necessary to provide top vocational education programs, and (4) Secondary schools of an area or region may devise vocational, technical, occupational, and special interest programs to meet the need of all students by pooling their resources. Summary responses to the assumptions presented were, respectively, (1) "Meeting Man's Destiny--The Future Now," (2) "How Education Should Fit a Person for the Life He Pursues," (3) "New Designs for Administration," and (4) "Implications for Administrators and Counselors." A list of promising ideas and suggestions from the participants is included. Names and positions of the participants are also given. (EM)

A REPORT OF A PENNSYLVANIA CONFERENCE/BUCKS COUNTY PUBLIC SCHOOLS, STATE OF PENNSYLVANIA

New Horizons in Vocational-Technical-Occupational Education

A Report of a Southeastern Pennsylvania Regional Seminar for Secondary Principals and Counselors, June 28–30, 1965. Sponsored by Bucks County Public Schools with the Cooperation of the Vocational Education Division of the University of Pennsylvania. Published by Bucks County Public Schools, Doylestown, Pennsylvania. Copyright © 1965, all rights reserved, printed in United States of America.

preface

Two premises are basic to the fulfillment of educational goals in contemporary American culture: one, the discovery of improved methods for bringing the potential gifts and interests of youth and adults, the changing demands of society, and the resources of the school into a harmonious relationship; two, increased emphasis on educational training for a world of work which will lead to self-sustaining individuals and a dynamic society.

Only under these circumstances can educational institutions fulfill their major purpose—the development of citizens who are able to understand, adjust to, and modify the cultural environment in which they live and to which they must respond.

It is our hope that the report of this conference will contribute to a clearer understanding of these premises.

GEORGE E. RAAB—Superintendent, Bucks County Public Schools

The Why and How of The Conference

Goals

To better understand the forces in society helping to shape our educational programs.

To better understand the purposes of schools in responding to these forces.

To develop new insights in providing, improving, and extending programs for our students.

To identify procedures which facilitate vocational-technical-occupational programs for local schools.

To develop procedures to help students identify and use their talents.

Expectations Of Other Leaders

FROM THE NATION'S CAPITOL

United States Commissioner of Education Keppel "... we must assure every child the opportunity ... of an education commensurate with the highest level of his ability ... (that) is relevant to the realities of life in this half of the twentieth century. High school principals and counselors have a primary responsibility in this task."

United States Secretary of Labor Wirtz "Whether our nation ... is able to progress and to fulfill its promise will depend on the education and training that our young people acquire. The importance of vocational-technical education to prepare young people in today's jobs cannot be too heavily stressed."

President American Association of School Administrators Brain "... can create public understanding and stimulate leadership essential for the support of programs ... responsive to emerging local and national needs."

Executive Director American Personnel Guidance Association Hitchcock "No more urgent topic ... of greatest importance ... since... state and

THE CONFERENCE REGION

local school systems . . . now have the responsibility to carry through a national mandate for action . . . as to how this program can be most effective."

FROM THE STATE CAPITOL

Superintendent of Public Instruction Hoffman "The conference (and discussions of your mutual problems) can be the vehicles to transmit knowledge and understanding . . . to the administrators and counselors. . . ."

Secretary of Labor and Industry Young "The invaluable experience from pioneer efforts . . . should contribute much to the conference. There is no doubt as to the role of the vocational-technical school in the community and the vital contribution it makes to both the worker and industry."

Lieutenant Governor Schafer "Pennsylvania takes pride in having an environment which is conducive to business, industry, and everyday living. Our state has gained a prominent industrial reputation through the cooperative efforts of the state government, the schools, and the community. This conference is a further indication of our commitment to the educational opportunities in the vocational-technical-occupational fields of endeavor."

Origin And Growth

THE REGION

Eastern Pennsylvania lies in the heart of a vast megalopolis stretching from Boston to Washington, D.C. Cities are ringed by suburbs and beyond the suburbs is the land, the mountains or the ocean.

The region has been described as a typical crossroads of the United States. Talent, success, poverty, unemployment—all the human conditions are here. Densely populated in its industrial sections, it represents a melting pot of newcomers from a variety of backgrounds and races. Beyond its congested complexes and cultural and educational centers are farms, small boroughs, isolated areas.

Within the boundaries of the region are the counties of Berks, Bucks, Carbon, Chester, Delaware, Lackawanna, Lancaster, Lebanon, Lehigh, Monroe, Montgomery, Northampton, Philadelphia, Pike, Schuylkill, Wayne. In the southeastern portion of the region is Philadelphia, the historic fourth largest city of the United States. West of the region is the state capitol, Harrisburg.

THE INTERESTS AND NEEDS OF ITS PEOPLE

The region comprised of sixteen counties represents about one-half of the resources of the state of Pennsylvania, including **46** percent population of the state, **52** percent workers of the state live in this region, **50** percent market value of real estate is contained in this region, **55** percent of the state's business and industry located in this region, and **50** percent value of the products produced in the state come from this region.

The needs of the youth of the region and the state in the field of vocational training are diversified and self-evident.

Pennsylvania ranks 45th in the United States in providing vocational education according to the President's Commission.

Thirty-five percent of its secondary students do not finish high school, and 35 percent of its high school graduates seek no further training.

THERE ARE MANY EVIDENCES OF EDUCATIONAL ACCOMPLISHMENTS

The first area vocational technical school to be built in Pennsylvania was opened in 1958 in lower Bucks County. Originally constructed to provide for 750 students, its facilities have now been expanded to provide for 1500 student enrollment. Its graduates have a ninety percent rate of employment.

The total region is now actively engaged in planning, building, and operating such schools. Within seven years, 26 area schools have been approved for this region, the majority of the counties having more than one school. Within Bucks County currently one area school is in operation, another is under construction, and a third has been approved for construction, thereby assuring the availability of educational opportunities to young people in each of the three sections of the county.

Educational leadership has characterized the region. Experienced principals and trained counselors operate its secondary schools. New community colleges are underway to provide continued training for all students. Collaboration with institutions of higher learning in this area has enhanced cooperative projects and planning.

WHY A VOCATIONAL EDUCATION CONFERENCE NOW?

This conference was organized in response to the interests and needs of the region and in response to national and state re-examination of the role and functions of vocational education.

Approximately 180 leading secondary administrators and counselors of the region participated in a three-day intensive discussion of goals, practices and procedures. A series of discussions was led by outstanding educators and vocational specialists. Emphasis was given to meeting the challenge of Today and Tomorrow. The conference was made possible through a grant from the United States Office of Education through the cooperation of the Pennsylvania State Department of Public Instruction.

New Horizons as seen by Educational Leaders

Lifting Our Horizons To Meet Our Goals

A summary of presentation by
Dr. GEORGE E. RAAB, *Superintendent*
Bucks County Public Schools

UNDERSTANDING THE FORCES WHICH SHAPE OUR EDUCATIONAL PROGRAMS

The major issues facing society today are potent forces which must be taken into account as we shape our educational aspirations for tomorrow. The population explosion, the reality of civil rights, the Communist threat, poverty, and unemployment are social challenges, and each of these has significance for educational purposes, school curriculum, and classroom methodology.

Of special relevance to vocational education are the following three factors.

Our population is highly mobile and is concentrated in big cities and suburbs. One out of five Americans changes addresses each year. One out of four lives in a state other than his home state. One out of 37 pupils attends school in New York City.

Our labor force by 1970 will be drastically changed. It will increase to 81 million workers, increasing 67 per cent in positions requiring 16 years of education. Two million new jobs will involve technical skills; 2 million unskilled jobs will become obsolete.

The positive correlation between education, employment, and income will increase. About 2/3 of school pupils complete high school. About 2/3 of unemployed have less than a high school diploma. Six out of 10 earning $15,000 or more have some college training. Seven out of 10 earning $3,000 or less have not completed high school.

UNDERSTANDING THE PURPOSES OF THE SCHOOLS IN RESPONSE TO THESE FORCES

If the school curriculum is to be kept modern, administrators and counselors must continue to interpret the cultural, economic, and occupational life of contemporary society. Knowledge doubled in the civilized world by 1750, again by 1950, and again by 1960. This accelerated trend will continue.

The purpose of education is to develop and perfect the qualities of each individual so that he may make a useful contribution to society. Neither business nor education is an end in itself. Materialism without purpose is meaningless and education solely for the sake of education is no better than preparation to live in a vacuum. Zest for learning must be tied to the practical web as well as the academic web, lest the total human fabric be weakened. Continued emphasis must be placed on social, moral, ethical, human, and decision-making values for all people. In the interest of pragmatism we must not lose sight of humanism. Therefore, nursery school, kindergarten, high school, and college must continue to instill in human beings moral, ethical, spiritual, and self-educative values brought about by thorough exposure to the humanities.

School attendance and drop-out attitudes must be dealt with at a time when a difference can be

made. For those children yet to come to our schools, increased emphasis must be placed on their early years as an integral part of the total educational spectrum. This means increased use of psychological services for diagnostic and educational planning rather than for remediation. A meaty comprehensive exploratory program should be planned for the early school years. Nursery school and kindergarten programs should be built in as the first rung of an integrated thirteen or fifteen year educational ladder. Constructive attitudes for school drop-outs should be reclaimed, restoring their self-confidence, and redesigning their purposes in life by the provision of an educational menu that whets their appetites.

Public responsibility for education beyond the twelfth grade must be expanded to include a community or junior college program and to include full-fledged post secondary thirteenth and fourteenth grades which place emphasis on human values as well as skills for earning a living. Pennsylvania with thirty-six community colleges and junior colleges ranks low in its current capacity for enrollment, whereas Florida, Illinois, Michigan, New York, Texas, and Wisconsin are at least twice as well off. The addition of specialized collegiate courses in subject matter areas does not eliminate the need for any of the present courses at high school levels. Rather, it demands the addition of new courses and a coordination of current courses in such a way as to complement changes at the collegiate level. Likewise, the establishment of a community college does not eliminate the need for discharging responsibilities for vocational-technical education at the secondary level. It demands that expanded efforts be taken at all public school levels.

The area vocational-technical school must be seen as a department of each of the participating home high schools, thereby extending the comprehensive scope of participating schools. The AVTS should be designed to broaden opportunities which would be unavailable to our students otherwise. Such expansion of the education program provides better education for those students remaining in the home high school and provides a more comprehensive opportunity for all students.

DEVELOPING INSIGHTS IN PROVIDING, IMPROVING, AND EXTENDING PROGRAMS

Vocational education in secondary schools will be systematically tied to strong elementary guidance programs, to high school internships, and to adult schools, community colleges, and collegiate offerings. The administrator must respond with maximum sensitivity and with prudent haste to the changing social, cultural, technical, and emotional currents of his day. The administrator must find ways to excite the total educational hierarchy (teachers, parents, school directors, community, and teacher-training institutions) to respond to its important role. The success of any enterprise depends upon the quality of its personnel. Special emphasis must be put on the selection and retention of top-notch personnel who are more adequately compensated for the important services they render. Educational programming (not tax millage or costs) with adequate provisions for vocational-technical-occupational training is the priority consideration for the initial location and continuation of businesses and industry in any one section of the country.

IDENTIFYING PROCEDURES FOR FOSTERING TALENTS

The best educational program in the years ahead will lead to self-educating, self-starting, self-esteeming, and self-sustaining citizens. Excellence in education will be based on our ability to provide for the uniqueness of each individual's potential so that he may become productive as a worker, as a citizen, and as a human being. Every student must be encouraged to get as much education as he has the ability to consume and every counselor and principal must see to it that he is consuming what is appropriate for him. Educators must invent and develop new tools to challenge the student to excitement in learning and to self-educating ideals.

IDENTIFYING PROCEDURES WHICH FACILITATE PROGRAMS

The focus of guidance and administration will be to shape new programs to match unique talents and abilities. Superintendents, principals, and counselors must make administratively possible those practices which we have come to believe are educationally desirable. We must stop making education the slave of administrative convenience (scheduling classes, transporting pupils, and all the minutia). Educational convenience for youth must be our watch-word and administrators must serve this purpose.

Administrators must make certain that teachers are abreast of the rapid expansion of knowledge

in order that methodology and curriculum do not become obsolete through teacher obsolescence. We must build into the teacher's explicit responsibility a time for self-growth and retraining so that his time spent on instruction of youth is most fruitful. We must expand industrial arts into the elementary school as part of our general education and expand industrial arts at the junior and senior high school level to become an integral part of student's general education and career exploration. We must find ways of utilizing our existing school and community resources whether it be adult evening classes, occupational training, summer industrial training, or the twelve month use of the school.

Let's lift our horizons. In the process let us not lose sight of the people for whom our horizons were lifted. Have we lifted the horizons of students, have we really opened the eyes and ears and hearts and minds of youth to new doors of learning, to new self-respecting ideals, to new attitudes? Is each student educationally fitted to his own talents, does he become master of his own destiny, can he help create a productive, beautiful, and peaceful world in which to live?

We will find ways of dignifying the process of preparing to earn a living. In order to accomplish this, we must understand and respect the integrity of each individual and his chosen career. We must accept that the vocational process goes on all during our lives. We must accept that a major effort must be exerted to fit school experiences to students' unique gifts. Whether these gifts be large or small, this is our charge.

A Framework For Conference Thinking—Four Assumptions

Prepared by
Dr. FINIS E. ENGLEMAN,
Executive Secretary Emeritus,
American Association of School Administrators
Dr. LUCY T. DAVIS, *Research Associate,*
Educational Research Council of Greater Cleveland

PURPOSE OF ASSUMPTIONS

These Assumptions were developed for outstanding educators in southeastern Pennsylvania who are responding to current forces and values which are pushing the thinking of educational leadership today. The conference provided for an examination of issues that transcend geographical, physical, and mental limitations. It is hoped that such examination will serve as a springboard for actions by conference participants.

THE ISSUES AT STAKE

The issues in the world of work demand a regional, national, and international view due to the relationship of population expansion and mobility to our economy, invention, and discoveries. Employment, education, the pursuit of the good life offer opportunities for local action on important issues. Leadership in southeastern Pennsylvania can testify that the nation's ill fed, ill housed, ill educated have direct reference to local affairs.

To identify with the world of work is to swim in the stream of Life itself. Work is one of the three commonalities of human life—as characteristic as birth and death to the twentieth century American man and woman. Through his work, Man achieves his human potential. It has been said, "Work is love made visible", and also, "Bake not your bread with bitterness".

The world of work, so relevant to the purposes of secondary education, seems somewhat removed to many school people. Somehow, with our interest in book learning, graduation points, grade averages, college scholarships, we have become more isolated from the great resurgence of national energy and productivity, currently surpassing the efforts of World War II.

THE RESPONSE OF SECONDARY SCHOOL LEADERSHIP

Secondary leadership has a tradition of executing its responsibilities. Never before has it had the opportunity to be such a gatekeeper. Who else has the challenge to educate all the youth in the largest democratic program under public jurisdiction? No other educational unit is so charged, not only that the individual is educated to pursue a calling, but also that he has the motivation and the spirit to pursue. How? When? Under what conditions? This was the job of the conference.

It is our belief that, if we as educators do not join hands in conviction and action, we will be like the sleeping giants. Other forces in our society, acting on an idea whose time has come, will institute types of parallel public systems, not now incubated, to fulfill the dreams and the commitment of the American people.

Assumption I

THE GREAT EMERGING CONDITIONS OF LIFE

Great emerging conditions (scientific, technological, social, political, economic, etc.) are changing the nature of life itself.

Adequate vocational skills and knowledge in a given occupation today will be obsolete ten years hence, thus requiring continuous retraining by the schools.

New occupations requiring new competencies will multiply during this generation while many present vocations will disappear.

Service type occupations will tend to increase rapidly while material production jobs will decrease.

The rate of production will increase as automation and technology improve. Drastic revisions may be necessary in our concept of full-time employment and full-time production due to shifts in work weeks, etc. Man's image of himself as a producer and consumer accordingly will be revised greatly.

Education for leisure or non-compensatory occupations may transcend in importance education for compensatory work for more human beings and for the national welfare.

The current spending pattern of the USA suggests that national defense or social welfare require higher expenditures than education.

Preparation for citizenship becomes much more difficult as society's problems become more com-

plex. The incompetence of the citizen on social issues requiring depth thinking may invalidate the principle that a just government gets its powers from the consent of the governed.

The extent to which we provide for diversity and uniqueness in our educational programs may determine our national power and survival, even that of the entire world.

In a world of turbulent change, more and more attention will be focused on what is unchangeable.

A Response To Assumption I: Meeting Man's Destiny—The Future Now

A summary of presentation by
Dr. SHIRLEY COOPER,
Associate Executive Secretary,
American Association of School Administrators

Our hopes, our goals, our beliefs, our recreation are shaped in great measure by the life about us, the circumstances in which we live and try to get along in the world.

The deep-seated and almost universal desire of people to get along in the world has meant: food to appease hunger, clothing and shelter for comfort, a home and family, a job that claims the approbation of one's associates, a measure of self respect, compatible relationships with other people, and a chance to be somebody of worth, importance, and dignity.

The values that people have, the accents, the appreciations, the criteria of moral behavior are derived and evolved in the milieu of environmental forces. To abstract human beings by some technological process from their functional relationship to the world about them with all of its creative persistence would be to abstract them from life itself. They would be robots—automatons—empty shells. The forces around people—children and youth in particular—enter their philosophies, mold their natures, and make them what they are—confident, strong, high-minded, proud, compassionate, and trustworthy—or cruel, treacherous, lazy, unreliable, rebellious, dishonest. The compelling forces of life as they touch individuals on farms, in mines, in suburbs, and in the slums are among the greatest teachers. It is the massive aggregations of cultural forces—economic, psychological, social, physical—sunlight and shadows, beauty and ugliness, frustrations and satisfactions that grasp people and mold them to their likenesses.

Almost suddenly we are in a new age in which values are shifting, an age characterized by new forces—an age in which old and familiar opportunities are wiped out and new ones emerge—an age in which the strong back is much less important than the sharp mind—an age in which people live literally stacked on top of each other in high-rise apartments.

The forces that affect and shape men's lives, that determine how and the extent to which they get along in the world, have become highly complicated, technical, rapidly moving, and efficient. They demand a degree of skill, alertness, and understanding. If these new and powerful forces are to be harnessed and managed to the best interests of all people, integrity and high purpose must be deeply imbedded in the commitments and the actions of all people. Perhaps the greatest challenge to people in this new age is to learn how to manage the creatures of their inventive genius rather than let them become unmanageable forces that crush the lives and spirits of great groups of people.

For a generation school people have estimated the alertness of young people in the schools by an index of intelligence. In a simpler society there was opportunity for people in the lower limits of the intelligence distribution to make a place for themselves in the world. It was these people who provided the strength and stability of neighborhood and community life. They were people of importance. They had a place in the world. They made some contribution to the well-being of the total community.

Through long tradition, American people have been energetic people. Pride in work, in an honest day's labor, is deeply imbedded in the mores of this country. Pride in being master of our own destiny is deeply imbedded in our tradition. Pride in being able to have a home, rear a family, and see our children do better than ourselves has been deeply imbedded in our national purpose.

The United States was founded and has been developed on the basic premise that everybody is important, that everybody has a contribution to make and a fighting chance to develop the best that is in him. Now we are placing great groups of people in circumstances where forces beyond their control overpower them, crush them—deal them out. The people of the country as a whole are aware of it. The action of the Congress in recent years clearly shows the nationwide concern for this awesome problem.

Now in this age, due to forces that are emerging in the total culture, these purposes, traditions, and deep-seated desires for many people are being shaken, trampled, and pushed into the background. The end is not in sight.

The one great hope in dealing with this problem that has emerged from the culture is education. The challenge has been extended to school people throughout the land. How to meet the challenge still remains a question.

The solutions to this great problem will not be found through legislation. They must come out of the creative and imaginative thought of the men and women of this country who are deeply sensitive to the needs of people; who know the feelings, the aspirations, and the disappointments of young people; who understand better than anyone else the processes and factors that are involved in teaching and learning.

This is a wonderful age—an exciting age—an age in which the seed bed is fully prepared for creative thought and new developments. It is impregnated with the spirit that brings a wide opinion of choices and a feeling that human capacities heretofore untouched may be awakened and used for fruitful purposes. The energies which machines have put at the service of man do not and should not strangle him or deprive him of freedom at any point. There is nothing good or bad about a machine; it has no moral qualities. It is only in the manner through which this machine is used or the purposes to which its energies are directed that has moral consequences. These decisions rest with the people. These decisions depend upon widespread understanding, high purposes, and full integrity.

Within the next generation, one could well believe the fact that the earth will literally be made over. Schools will have new structures and a new look. Challenges and opportunities will emerge in greater proportions. Cities will be rebuilt. Production and distribution methods will change.

But there are eternal verities which cannot be grossly violated. Man is an integral part of the wondrous workings of all nature, the water, the air, the land, and all growing things. The inner spirit, deeply implanted in the hearts and minds of all people by the powers of knowledge and reason, which insistently calls for social justice cannot and must not be crushed. If history has taught us anything, it has taught that when injustice is harshly imposed upon people for a long period of time, undercurrents of emotion build up and inevitably erupt in violent explosion. This is a corrective measure that is built into the great processes of all life. It may be the upsurge of a minority group. It may be the rebellious acts of juveniles in the slum sections of a big city or on the university campus. Or it may be the revolt of an individual boy who feels injustice in a classroom of a country school.

In the great symbiotic relationships of all life and all nature, compensating penalties must be paid for violations of the eternal verities. If man mars the landscape, he is deprived of its beauty. If he pollutes the rivers, he must endure the stench. If he fouls the air with noxious gasses, he must breathe its impurities and pay an awful price in discomfort and disease. If he creates conditions that make living on the face of the earth too hazardous, he must build his habitat beneath the ground. And if the forces of society strip the mantle of human dignity from great groups of people and deprive them from playing useful and meaningful roles in life, corrective measures must and will be taken. If man is to be master of his own destiny, he must accept and carry the responsibility for his actions.

The wondrous change that holds so much promise always seems on the point of getting out of hand. Forces are generated which chafe against the fragile banks of cultural discipline. And there is no assurance that the powerful implements placed in the hands of all leaders for molding public opinion will always be in the hands of well-meaning conscientious people.

One needs only think of how a relatively small group of people, marching along a country roadside near Selma, Alabama, with the eyes of America—and the world—focused on them by radio, television, and daily newspapers, moved the national Congress to enact legislation to safeguard the voting rights of Negro people. No thoughtful and seriously minded person can conscientiously object to the purposes for which this powerful implement was used at this time.

The cultural forces that man has created are for the most part neither good nor bad. They have moral consequences only as they are related to the eternal verities of all life. It is the inward impulse, related to the basic rightness of the use that is made of these cultural forces, that really has significance.

The true destiny of man in this age, as it was in the long ago, is to be sought in how he uses his possessions and his tools and his equipment in a cooperative alliance with the great forces, the Eternal Verities, of all life.

Assumption II

EDUCATING A PERSON FOR THE LIFE HE WILL PURSUE

The Great Emerging Conditions of Life are to be understood and planned for in our current educational program.

A youth's educational program is a **total experience for him,** although it is composed of many experiences including academic and vocational.

Each youth's program should have some common denominators with all other youths' programs. It should have some uniqueness due to diversity in the depth of human skills, abilities, and interests, and due to the diverse and complex needs of society in which the youth lives.

The best educational programs in the years ahead will specialize in providing for the uniqueness of each individual's potential to be a productive person as a worker, as a citizen, as a human being.

As new knowledge multiplies, educators must find new ways to classify, new approaches to discovering basic principles and generalizations, and faster methods of transmitting knowledge and perfecting skills.

Population increases will require significant increases in school staff, school resources, and budgetary support.

Vocational preparation including the performing arts, the humanities, etc., will be as important as the technical courses leading to expert auto repairmen, dental technicians, or stenographers.

This generation may be characterized as "learning a living" throughout a life span.

This learning is related to the whole man—his self-sufficiency, his productivity, his mental health, his well-being, his compassion. His academic and vocational learnings are developmental and are interrelated in the unity of his outlook and actions.

Since the average person will work in three distinct occupations during his lifetime, non-specific vocational learnings may be more important than specific training.

We are woefully ignorant about the points at which unemployability is reversible, and how and when education can reverse this process in a person.

The survival of our democracy—the liberty of free men—may depend more on our massive ability to educate the minorities with deficits—the economically depressed, the culturally deprived, the physically handicapped, the mentally limited, etc. —than on the minority of the intellectually elite.

A Response To Assumption II: How Education Should Fit a Person For The Life He Pursues

A summary of presentation by

Dr. LESTER NELSON, *Educational Consultant, Formerly Associate Program Director, Education Division, Ford Foundation*

In a free society public education is primarily concerned with the individual. In our free society even more than earlier societies, the individual does not live in isolation from society. The character of society is determined by the effect which education has on the individual's attitudes and action, on his motivation to be a learner.

What is done well in the classroom and the laboratory or, perchance left largely undone, profoundly affects the entire quality of personal and social life, the values by which man lives, the things we cherish most, the ends for which men strive.

It cannot be over-emphasized that the primary purposes of our schools, of education, is nothing less than the achievement of free persons in a free society. Decisions affecting education should be firmly tested against this major purpose.

By what criteria is education to make the decisions so urgently demanded by society and by individuals caught up in change?

CRITERION NUMBER ONE

Does the proposed decision or action promise significant extension of equal opportunity for individuals to gain more, better, or more appropriate education?

Extended opportunity for education of higher quality and greater relevance to the individual should be an indivisible concept, resting on the prime educational commitment to the individual as a free man in a society.

The criterion must be applied with flexibility and imagination, not used as a blueprint or bill of particulars. The exercise of judgment in decision-making and action becomes a primary test of skill rather than a simple demonstration of will. The professional challenge, therefore, is to our will and our skill rather than merely our insights and our sympathies.

CRITERION NUMBER TWO

Does the proposed decision or action hold the promise of long-term support for individual motivation toward continued learning as well as more immediate rewards to the individual from current learnings?

A minimum education must combine two complementary levels of achievement and competence. It must include an individual level of developed intelligence and acquired skills requisite for some kind of useful, acceptable and gainful employment. It must also include the development of abilities and motivations requisite for upgrading of initial skills or the acquisition of new skills.

The blight of ignorance and low human aspirations is to be found everywhere. Lack of insight or prejudice are no less a manifestation of ignorance than the lack of knowledge in its more academic form.

The individual who lacks motivation to learn the skills for gainful employment is not a free man in our modern, technological society. In the life-spans of those now in our elementary and secondary schools, the vast majority is most likely to embrace three or more vocational commitments. Each change of this vocational commitment will require additional learnings and new kinds of skill or modifications of existing skills.

CRITERION NUMBER THREE

Does the proposed decision or action maintain a desirable balance between those learnings and skills required by one's vocational commitments and those from which one derives understanding and insights required of the intelligent and contributing citizen in a free society?

All learning seems to be many-sided. Differences in method, timing, content organization, individual backgrounds and a hundred other variables, each unique in a unique situation, support such an assumption.

The balance called for is more than that of equating course labels, one against another, or parceling out time, or the determination of "credits." It involves all of this but it also involves other equally important matters the methodology and quality of faculty, the institutional culture, the degree of homogeneity of the faculty and student body, and others. Desirable balance cannot be established by formula and flexibility is essential.

CRITERION NUMBER FOUR

Does the proposed decision or action move in the direction of tomorrow's probabilities rather than merely today's immediate pressures?

One does not quarrel with the desire of technical education to meet immediate needs but programs limited to this spectrum fail to look ahead as they should.

Just as we have been engaged in distinguishing between vocational, occupational and technical education, we need to take a long, hard look at technical education itself, and arrive at a significantly broader definition and perception. If a technician is properly described as one who works with a professional, then one may ask whether future technicians may not be in greater demand in such fields as teaching, health services and so on, than will be true in the areas of production?

Is it not relevant to ask whether two-year programs for educational technicians may not offer a promising new approach to the problem of professional under-supply in the years ahead?

Three clear implications should be recognized for educating free men in a free society.

A free man must enjoy opportunity for employment as a general condition for economic independence.

Increasingly the opportunities for employment will be related to new types of activities, especially in providing services.

It is incumbent on those who are responsible for educational actions to test such decisions against the criterion of future probabilities rather than by today's pressures alone.

Better and more appropriate educational opportunities must exist if our youth are to be fitted to pursue a life of individual fulfillment, continuous learning, civic competence and personal freedom in a free society.

Upon the presence or absence of appropriate learning experiences will hang the issue of the individual's educational fitness. The responsible educator may not subscribe to a doctrine of resigned acceptance of what exists. Nor can he satisfy his sense of responsibility or his emotional needs merely by protest. He cannot escape making decisions and engaging in the action. In so doing, perspective is essential. Criteria to guide his thinking and buttress his judgment are required.

Neither individually nor collectively do the criteria listed here provide any answers. Their application will substantially enhance the role of redefinition in education as compared with the role of endless refinement.

Assumption III

NEW DESIGNS FOR ADMINISTRATION OF VOCATIONAL EDUCATIONAL PROGRAMS

Local, area, regional, interstate planning will be necessary to provide top educational programs of vocational preparation.

Communication between local, regional, state and federal officials will be more necessary as a means of transmitting information, creating awareness of changes, and mutual action for improvement.

The structure of regional relationships will be characterized by sensible, economical and practical arrangements.

Administration of such programs will require cooperative relationships, interdependence, extensions of local concerns and responsibilities.

The good school will insure the relatedness of educational and vocational offerings so that correlation of teaching will facilitate the learner's integration of his learning.

The most important vocational courses, grades 1–12, are the basic skills of reading, writing, and arithmetic based on competence to interpret and communicate.

The most important vocational learnings of the school program are those which are transferrable from one job to another or from one level of competence to another of competence within the same job classification.

Vocational education in secondary schools will

be systematically articulated with strong elementary guidance programs, with secondary internships, field work, and with post secondary offerings (adult schools, community colleges, collegiate offerings).

The focus on selecting students for vocational programs will shift to devising programs for students—that is, assisting a student in creating a work-study program for his particular talents and abilities.

The top priority of the administration of programs will be to organize, execute and create schemes for providing conditions of learnings which do not become obsolete.

Continuous re-education of a professional staff to meet the changing conditions of people, occupations, knowledge will be the chief job of the secondary principal.

Of all the occupational groups in the USA, the one in greatest need of re-training is the teacher.

The counselor will be deeply involved in the devising of curriculum programs to fit people, and to use his resources to help teachers assist students in making wise vocational choices.

The curricula program of modern secondary education should be sufficiently diversified and specialized as to satisfy the intellectual and occupational interest and aptitudes of all pupils.

Although many youth should postpone specific education for work until after high school graduation, there are many who can profit most by developing competence in an occupation prior to graduation.

It is unlikely that the ordinary secondary school can meet the unique and diversified interests and aptitudes of all pupils; an area special school can economically and more feasibly meet these needs for some pupils.

The area special school may function best as a subsidiary or a service unit for the several feeder high schools and not as an entity in itself.

The primary over-riding goal of the local and area schools is to release the potentialities of each student, and of similar consequence to relate the special educational enterprise to the educational programs of the home high school.

A Response To Assumption III: New Designs For Administration

A summary of presentation by
Dr. C. TAYLOR WHITTIER, *Superintendent Philadelphia Public Schools*

Education Has A Tradition Of Facing Up To Problems

No longer are problems purely local, nor are they limited to the borders of the state. Education is a national concern. Patterns of cooperation for problem solving extend throughout local and regional areas and the nation.

Leadership And Training Are Essential To The Progress And Development Of Vocational Education.

Leadership is a public function, and should be exercised by the public schools. It is not limited to leadership of higher education seeping down to public schools. Leadership is characterized by a desire and willingness to question what is being done and how to improve it. Changing patterns of education are necessary due to the great increase in knowledge and the number of talented people available to improve things. We should seek answers to what children need rather than defend what we are already doing.

The Most Important Leadership Is Concerned With The Human Element, And A Creative Approach To Releasing The Potentials Of People.

How can we involve our people so they are really able to work creatively?

How can we apply the principles of learning that we already know?

How can we come up with ideas worth trying rather than emphasizing why they won't work?

How can we start early enough with attitudes of children in ways that make a difference? Towards work? Towards people? Towards aspirations?

What kinds of research activities can we learn from? What about the teacher researcher, cooperative training programs, opening doors to invention rather than closing them?

What kind of gatekeepers are needed in education? How do we serve new opportunities and new needs?

Real leadership will respond to the issues in vocational education and will organize training programs to do the job. Such programs will develop through cooperation, not isolation, and through continuous, not sporadic, efforts.

Assumption IV

IMPLICATIONS OF A NEW DESIGN FOR ADMINISTRATORS AND COUNSELORS

Secondary schools of an area or region by pooling their resources may devise vocational, technical, occupational, special interest programs to meet the needs of all students.

These needs may range from one course for a very unique talent or interest to a unified program for the special talents of many whose education may be best provided in one location (due to facilities, machines, specialized instruction).

Extended programs in languages, creative arts, higher mathematics are as necessary for a few as extended programs in mechanics, computers, etc.

The idea of regional cooperation to meet the diverse needs not easily met under the single secondary roof requires team imagination and leadership. It may or may not require the construction of a centralized facility.

If economical or feasible, a program specialization, developed in a local high school could serve all students of the area or region. If more economical or feasible, local students may attend an area facility.

The criterion for the establishment of courses in an area facility should be the needs and interests of the local schools best served by a course or program in that facility. In this sense the area school

truly serves a community; it avoids the stratification of non-college bound youth and it enlarges its services to the total community.

For whatever courses are taught in a separate service unit away from the secondary school, such teaching should be in collaboration with teaching in home high schools. The exchange of faculty ideas, the growth of mutual respect and trust can only be achieved through some working knowledge of each other.

The comprehensive goals of area cooperation should be developed cooperatively among all staff members teaching general education or vocational subjects.

Where an area special school exists, the principals and faculties of all cooperating schools have grave responsibilities for developing flexible schedules, inventing techniques for cooperation, writing and adopting a philosophy that sets goals, roles, relationships, and machinery.

In the larger context of area cooperation, new roles are assumed by principals, counselors, teachers of the home school and the area school, students, and parents.

What is educationally desirable for students should be made administratively possible.

Geographical distance should not create educational separation.

A Response To Assumption IV: Implications For Administrators And Counselors

A summary of presentation by
Dr. NATT BURBANK, *Professor of Education, Lehigh University, Bethlehem, Pennsylvania*

A principal and his staff face some specific assignments as they move forward in the vocational field. First in importance is the necessity to build understanding on the part of the superintendent and the school board. The challenge to the principal and his faculty leaders is to envision and implement a pattern of secondary education which provides sound college preparation and a respected program of pre-employment or pre-technical training for all others.

The principal needs to learn how to use the vast resources available at local, state, and national levels to help in the formulation of this program. Industry, labor, business and government can be of important assistance. The advice of industrial leaders will give clues as to the types of training and re-training needed, and to kinds of training undertaken by industry.

COUNSELING WILL CHANGE

The attitudes and understandings of counselors are basic to success in this educational undertaking. Counselors will need to learn more about vocational education, its changing philosophy, its methods, and its requirements. It will be necessary to know about other training agencies, several of which may not be under public school direction. There are broader responsibilities for junior high school guidance counselors as well as senior high counselors. Students are entitled to unity in counseling and we should see that they get it. Every principal and counselor will be emersed in placement activities. Job placement is as related to the aims of guidance as college placement.

SECURING QUALIFIED TEACHERS

The search for well qualified teachers is likely to provide as much concern as any of the administrative problems. The rapid extension of technological change into the school curriculum has outstripped in quantity many of the teacher education programs in this field. Many industries are so interested in this movement that they will loan professional and technical personnel to the schools. Colleges and universities will need to provide superior preparation so that their product can carry out the program which vocational leaders envision for them.

BROADER EMPHASIS IN CURRICULUM

As teachers, counselors, administrators, school board members and resource people work on this vast educational pattern, a change of emphasis will certainly take place. We will move forward into the "cluster of occupations" approach, where broad group lines will be drawn. Work-study programs will be a part of any good vocational curriculum.

There will also be a place for top students to studv courses which can hardly be afforded in individual schools. It is not beyond reason to envision classes in Chinese and Swahili, advanced placement groups, or reading improvement studies for good students who want to read faster and better.

There are numerous curriculum issues to be met. New subject matter is required at every turn. The Carnegie Unit raises its head as the time allotments are laid out. New methods will be needed

to measure student competency. Other administrative issues to be met include scheduling, transportation, and co-curricular activities.

COORDINATION WITH OTHER EDUCATIONAL OFFERINGS

There is a great need for close coordination of the high school vocational program with the community college, the technical institute, and other agencies involved in the preparation of youth for employment. It is incumbent upon all parties in the field of vocational education to work closely and cooperatively with one another so that there may be no necessary and crippling duplication of facilities or programs.

EARLY NEED FOR FACILITIES

Of greatest importance is the question of planning facilities for new programs. It is imperative that those who lead the way be fully aware of the new dimensions of vocational education. Resources from within and outside the community are indispensable at this stage. It is fortunate to have an architect who is full of creative imagination and who will be champing at the bit to move ahead.

ADULT EDUCATION

Much of the training and re-training of adults and out-of-school youth will be done in day school vocational facilities. Such instructional spaces and equipment should be used as intensively as possible. Community interest and welfare demand that the needs of all citizens be served in the structures which have been financed by all taxpayers.

HELP FROM PUBLIC AGENCIES

Government agencies at all levels, both inside and outside public education, can help school authorities in the formulation of a vocational program. The United States and State employment services provide helpful analyses of the labor market and job placement. The school must be more externally oriented, so that it can respond quickly and accurately to conditions which change with greater and greater rapidity.

MORE RESEARCH NEEDED

Among the considerations governing long-range objectives is the need for more and better research in the field of vocational education. Money is available in substantial amounts for this purpose.

COOPERATION IS ESSENTIAL

New vocational education is going to be one of the major threads of our American educational system. The daily working cooperation between the high school and the vocational school must be complete and pervasive at all echelons of responsibility. For example, regular planning sessions should be scheduled for all principals and the top personnel of the vocational school to which they send their students. The essence of this relationship is found in the joint responsibility for the students. All are serving and should govern their actions accordingly. We have faced staggering problems in the past and solved them. We can do it again, so that the waves of youth flowing through our schools in the coming years can be well prepared for productive and satisfying employment in a vastly different kind of work world.

Continuity Through Cooperation

A summary of presentation by
Dr. CHARLES ROLLINS, *President*
Bucks County Community College

In addition to a population explosion and a knowledge explosion, we are experiencing an education explosion. No longer can we ignore continuity in and coordination of the various segments of our total educational system. Our children are now going to school at an earlier age and staying in school longer. During 1910 to 1960 the enrollment of five and six year olds almost doubled, the enrollment of 16 and 17 year olds doubled, and the enrollment of 18 and 19 year olds more than doubled. By 1970, the average American adult will have received a high school education. In the decade from 1950 to 1960, there was an increase of 25 percent in the number of college graduates in our nation.

The problems we face in education are great enough, and the demands placed upon our educational system are of such magnitude that it is imperative for us to evaluate what we are doing. We dare not consider the various phases of education as discrete or as segments of educational systems. Rather than assigning lowest value to the beginning school experiences and top stature to collegiate preparation, we face one overriding imperative—that of quality in all portions of our educational endeavor. Quality cannot be segmented; we cannot concentrate on providing only an outstanding community college program. We must concentrate on excellence throughout our educational program.

In teaching on all educational levels, effectiveness is achieved neither through chance nor magic. Effectiveness in teaching results from a happy combination of common sense, knowledge of subject, teaching skill, enthusiasm, force of personality, artful judgment, and much hard work. Superior teaching dwells not in the things of education but rather in its spirit. Great teachers have always enjoyed giving service to others. We are on the growing edge of knowledge and we must bend every effort to transmit this knowledge to the younger generation as efficiently as possible—which means we must cooperate and coordinate our efforts. We must function as an educational team for on the results of our efforts rests the future welfare of our nation.

Looking Ahead to New Horizons in Pennsylvania

Patterns For Providing Vocational Education

From comments by
Dr. JOHN W. STRUCK, *Director*
Bureau of Technical and Continuing Education
Pennsylvania Department of Public Instruction

Vocational education begins in the elementary school when pupils explore job families, and the work of their parents and their neighbors. Emerging interests and talents individualize each pupil.

In secondary schools, several patterns for providing vocational education include the comprehensive high school, and the Area Vocational Technical School. Community colleges, post-secondary courses, technical institutes, adult schools offer further continuity to vocational education. All of these institutional arrangements contribute offerings for the diverse interests of students and the diverse needs of society. They shorten the distance between the boy and the job.

Making The Local High School Comprehensive Through Area Vocational-Technical Education

From comments by
Dr. CARL MANONE, *Assistant Superintendent*
Abington Schools
Abington, Pennsylvania

Increasingly schoolmen are thinking of the comprehensive school in broad terms. They perceive the area technical school as a part of their own educational park or campus. The fact that several miles or a twenty or thirty minute bus ride is involved does not violate their philosophy of presenting a unified program for the student's total development. Many of these schoolmen feel that the area technical school is a rich and available "off-campus" resource that allows their own schools to be truly comprehensive — to provide for the non-college student a specific program of study and shop experience that prepares him more fully to take a productive place in the community where he will work and live. An area program can provide for larger enrollments, more course offerings, better scheduling, more specialized and up-to-date equipment, a more competent staff, and lower per pupil costs.

Extending The High School Curriculum Through Area Cooperation

From comments by
Dr. DIMITRO BOURANDAS,
Assistant Superintendent
Mr. RICHARD HOWARD,
Assistant Senior High Principal
Neshaminy High School, Langhorne, Pennsylvania

Gone are the days when a school was merely judged by the number of students it was sending on to college. Today, in greater accord with the Constitution of our country, the criterion of our time is how well we are achieving the maximum development of each child, regardless of IQ, motivation, behavior, race, religion or sex.

In 1964 Neshaminy became a participating member in the joint venture between certain high schools in this area and the Lower Bucks Technical School. A pattern of district cooperation has been

fostered in Bucks County through the regional film library, exceptional children programs, etc. Neshaminy Senior High School has a student body of 2300 in grades 10 through 12. Neshaminy initiated its program with 45 sophomores; over 200 senior high students desire to participate next year. Curricula offerings are available in such areas as automotive repair or mechanics, beauty culture, building trades, technical electricity, drafting, industrial chemistry, printing, machine shop, restaurant practice and welding. Students are admitted to trade and technical courses by virtue of their interest, ability, and aptitude as well as their previous academic record. Students may choose to be in the technical and vocational curricula starting in the 10th grade. Some openings in certain areas occur in the 11th grade and a few in the 12th grade.

In Neshaminy the four teachers who initiated this program were from the science, English, social studies and math departments. These classroom teachers accepted their pupils as individuals, all different, all important. The feeling of the teacher for inividual pupil is the keystone to guidance (and the subsequent success of a technical-vocational program). If such a value is not present, the administration might as well save its investment in the program.

Staff members who initiated the program met with a counselor and an assistant principal during the school year. They spent a day at the Technical School. They visited most of the classes at the Technical School, talked with their own students and their teachers. They lunched in the cafeteria where they were served food prepared by their students. At the Technical School, Neshaminy teachers were surprised to see how absorbed and how self-directed their students were.

In these meetings for Neshaminy teachers many curricula problems were discussed. Their solutions constitute the strength from this experience. Does a welder need to read Macbeth? Do we evaluate students' progress in terms of achievement or effort? With encouragement teachers have devised flexible course guides in the different subject areas which give common direction to many Tech students. The teachers mentioned that many Tech students felt neglected in aspects of school life, such as pep rallies, assemblies, class meetings. Steps are underway to improve this situation.

Neshaminy hopes that its cooperation with the Area Vocational-Technical program will establish with each student a genuine feeling of social responsibility, instill a genuine respect for the dignity of work, help each student acquire a saleable skill, and encourage each student to complete high school. Neshaminy's participation is based on the premise that its local industrial arts and home arts programs have been extended and amplified. It is based on the premise that our youngsters are receiving learning experiences designed to fulfill their special needs, learning experiences which we could not provide at our home school without a vast investment program in special staff, additional facilities, and costly equipment.

Responsibilities For Leadership In Area Cooperation

From comments by

Dr. HALLECK SINGER, *Director*
Vocational Teacher Education
University of Pennsylvania

What seems to be needed is preparation for the long-haul demands for occupational education not by a few school systems but rather by all school districts in all states. The overwhelming academic desire to prepare for college, which doomed the "academy" and has limited the high school in achieving its broad objectives, must make room for vocational education. A high school curriculum which meets the need of only one third of the population does not meet the needs of a nation. Broad vocational programs in secondary and in post secondary schools should prepare eight of ten pupils for the world of work.

What basic convictions should principals and counselors hold toward vocational education? Here are six convictions.

The honest work of the world **is honorable** and the preparation for such work must be honorable also. Vocational education is an **integral part** of the total education program. Vocational education is a **sound investment** in people. **Comprehensive programs** of vocational education should be available for all students who would benefit. **A broad spectrum** of offerings in vocational education is needed in order to provide for students' talents. Vocational education should **foster diverse talents** of students who will enter the emerging diversity of jobs in the world of work.

Vocational-technical programs must provide for a wide variety of occupational skills. Any vocational program of fewer than ten activities is probably inadequate. A more desirable number would be twenty, and large programs have fifty or more activities. When possible, each vocational course should be offered on more than one level of difficulty. All vocational students should have a good background in English and social studies. The length and depth of the courses should be flexible. Technical level subjects may need depth in mathematics and science while operative subjects do

not require as much general knowledge and skill in such subjects.

Cooperative Machinery To Organize Area Programs

From comments by
Mr. ROBERT JACOBY, *Supervisor*
Technical and Industrial Education
Pennsylvania Department of Instruction

Although certain types of vocational education have functioned well in individual high schools, other types of programs have functioned better with an area base for enrollment and curriculum development.

The characteristics of a successful area program are listed below.

> A well-designed attendance area outlines the geographical area of school districts and pupils to be served. An Area School should be planned to accommodate a minimum of five hundred pupils, so that a minimum of 12 shop-laboratory courses can be provided to accommodate boys and girls. A comprehensive shop and laboratory curriculum should provide for the varied interest and ability levels of pupils. Courses should be provided on three instructional levels. One of the main differentiating characteristics of the three levels of courses is the degree of mathematics, science, and technology involved in the occupation.

As of 1965, the Pennsylvania State Board for Vocational Education has approved 69 Attendance Areas in 51 counties. Of 12 recently approved programs, eight are in the eastern, one in the central, and three in the western sections of Pennsylvania.

Nine programs are planned for part-time service centers, and three programs are planned for full time schools.

In Vocational-Technical-Occupational Education, Who Is The Learner?

From comments by
Dr. CARL MANONE, *Assistant Superintendent*
Abington Schools

The learner is a young man or woman, generally of high school age, who by interest and aptitude can profit from a particular program offered by a vocational-technical school. The learner is interested in a specialized and saleable skill that will balance his general education, and which at the same time will give him the specific skills and knowledge needed to find employment in the world of work. The learner may be a person of very high intelligence who prefers a two, three, or four year technical education rather than a four-year degree program. He may, by virtue of interest or aptitude, be interested in pursuing an occupation where the academic requirements are less demanding. In any event, the learner is not a stereotype or simply defined individual. Rather, he is as diverse as humanity on the one side, and the wide array of jobs that invite his head and hands on the other.

From comments by
Mr. GEORGE M. SCHAFFER, *Principal*
Lower Bucks County Area
Vocational-Technical School

The learner may be an adult who wants to upgrade or update his working skills. Experience shows that adult enrollment in classes equals or exceeds that of secondary classes. The adult learner may be unemployed and need a short intensive retraining period in operative work. The learner may be retraining for skills which are currently required in his work. The learner may be a high school dropout who wants to obtain a skill and to gain a diploma. The adult learner profits from close cooperation between the area school and training in industrial facilities, and apprentice programs, etc.

From comments by
Dr. DONALD DIFFENBAUGH,
Assistant Superintendent
Montgomery County

Dr. N. DEAN EVANS, *Assistant Superintendent*
Delaware County

Mr. WILLIAM E. KEIM, *Principal*
Pennridge Senior High School

Do students desire this type of vocational education? County wide surveys indicate that in some counties 69 per cent of high school students desire some type of occupational training. Great opportunities now exist in planning programs to meet the needs of each individual learner. Learners are developing techniques which will help them with lifelong plans and decisions. With renewed impetus, educators are building curriculum programs with more flexibility and diversity.

Devising Curricula Experiences At Three Instructional Levels

From comments by
Mr. HAROLD B. ALBRIGHT
Director of Vocational Education
Montgomery County Schools, Pennsylvania

Instruction in the automotive trades may be offered at three levels.

The **technical** level is directed towards determining electronically the mechanical malfunction of the various parts of a car.

The **skilled** level provides training in the repair and maintenance of the engine, ignition and braking system, or training in auto body repair, the rebuilding and refinishing of automotive bodies.

The **operative** level provides training in maintaining automobiles, cleaning, balancing, checking, lubricating, etc.

A student through cooperative guidance and instruction can move through automotive training on the level which interests him and in which he can be successful. As basic interests are satisfied, new interests are developed and he takes the next step up the stairway of vocational preparation.

Organizing Curricula Offerings For Students

From comments by
Mr. REX E. WRIGHT, *Area Coordinator*
Industrial Education
University of Pennsylvania

Four types of curricula organization are underway in 13 new schools in southeastern Pennsylvania. These types of organizations include: part time half day for shop-lab or general education, part time week for shop-lab or general education, modified full time vocational school, modified academic school, full time vocational school or full time academic school.

Organizational arrangements should be supportive of educational objectives. An instrument for rating advantages and disadvantages of various arrangements is available through University of Pennsylvania.

Can We Afford Area Cooperative Vocational-Technical Education?

From comments by

Mr. FRED H. GLANDING, *Senior Coordinator Vocational Education University of Pennsylvania*

Pennsylvania Act 463 and Federal Law 88-210 have added many incentives. This legislation provides resources to assist in organizing a program, building and equipping a facility, and school operation. Cost figures from five buildings currently under construction indicate that local costs are 20 to 25 percent, while state and federal resources provide the remaining funds. For additional information, see a study listing state and national benefits to local schools published by Bucks County Board of School Directors, 1965.

Re-educating Professionals About Vocational Education

From comments by

Dr. THEODORE J. COTE, *Program Specialist Division of Vocational Technical Education United States Office of Education*

Vocational education is an investment in future taxpaying citizens.

Area cooperation insures broader offerings supported by a larger tax base.

Job placement is as important an outcome of education as college placement.

Talents and interests of students and needs of society provide the basis for program development. Teachers can see vocational choice as one aspect of general education.

Guidance helps pupils act on their obvious gifts and discover their latent ones. Many avenues of assistance are available to communities through federal and state legislation.

Keeping Up-To-Date Professionally In Vocational Education

From comments by

Dr. EDWIN L. RUMPF, *Assistant Deputy Director Division of Vocational and Technical Education, United States Office of Education*

Can we rediscover America — its purposes, its dreams, its promises for every human being? Much depends on what we believe in. Leadership in vocational education takes many forms on many levels. Professionals will find the following sources and surveys helpful in examining goals and programs.

Conant, James Bryant, *Shaping Educational Policy;* New York: McGraw-Hill Book Co., 1964.

Harbison, F. & Meyers, C. A., *Education, Manpower and Economic Growth;* New York: McGraw-Hill Book Co., 1964.

Harbison, F., *Manpower and Education;* New York: McGraw-Hill Book Co., 1965.

Okun, Arthur M., *The Battle Against Unemployment;* New York: W. W. Norton & Co., 1965.

Venn, Grant, *Man, Education and Work;* Washington, D.C.: American Council on Education, 1964.

Bridging the Gap Between New Horizons and Present Practices

The Conference As A Springboard

The conference offered many opportunities for each participant to examine the paths by which his school district might be more successful in achieving its goals for vocational education. As practical schoolmen, participants were concerned with closing the gap between knowledge and action, commitment and accomplishment. One of the conference experiences which demonstrated a way to close the gap was a field trip to a home high school and its area vocational technical school.

Throughout the conference, seminar discussions provided participants with opportunities to examine the ideas presented in the conference sessions. Group chairmen and recorders who provided leadership and continuity for the seminars are recognized below.

Group I — *Chairman,* Mr. George Elison
Director of Vocational Education
Allentown Public Schools
Recorder, Mr. Raymond Gutekunst
Area Coordinator
Industrial Education
University of Pennsylvania

Group II — *Chairman,* Mr. Clair Fitz
Senior Area Coordinator
Industrial Education
Pennsylvania State University
Recorder, Mr. Clyde Messinger
Area Coordinator
Industrial Education
University of Pennsylvania

Group III — *Chairman,* Mr. Merrill I. Hughes
Director
Vocational-Technical Education
Delaware County Public Schools
Recorder, Mr. Bryan V. Fluck
Principal
Area II Vocational-Technical School
Montgomery County Schools

Group IV — *Chairman,* Mr. Charles F. Middleton
Assistant Director
Vocational-Technical Education
Delaware County Public Schools
Recorder, Mr. Daniel I. Farren
Principal
Lehighton Area High School
Carbon County Public Schools

This section of the Conference Report presents a summary of participants' promising suggestions regarding key ideas and actions. The suggestions came from discussions of the field trip, from reports of seminar recorders, from written suggestions from more than half of the participants, and from many informal comments.

The Conference Sponsors have also provided a statement regarding the followup of conference outcomes.

Promising Ideas As Seen By Participants

The Importance of a Point of View Regarding Vocational Education —

the dignity of any job essential to Man's welfare, any useful work is honorable if well done.

Vocational Education as a Common Goal for All Students —

as developing talents of each student,

as personal fulfillment of the student,

as adequate preparation for life's work (including college preparation),

as developing employable skills.

Equality of Opportunity for Vocational Preparation —

the broadening of the curricula offerings,

the need for effective counseling,

the importance of the goals and attitudes of students.

The Changing Role of Vocational Education as a Challenge to Educational Leadership —

the common search of school districts for principles and practices,

building support by working with the power structure of the community,

interpreting the new image of vocational education,

the re-education of the teachers (academic and vocational) and their need to be informed.

The Area Vocational-Technical School — A Service to Youth and Adults —

evidence that it can and does work,

a function of the home high school, extended into another facility,

a response to the adult's need to have further training,

not a panacea for all problems.

Research Needed —

identification of choices made by students at various ages regarding occupational interests,

a re-examination of the role of testing (talents, aptitudes, etc.),

more knowledge about student's goals and motivations,

more evidence about outcomes of various administrative designs and arrangements.

Promising Suggestions For Action By Participants

Local school leaders should from a "New Horizons" point of view —

re-evaluate programs of vocational education,

secure qualified assistance in assessing present programs,

involve principals and counselors and teachers of home high schools in shaping area programs of vocational education,

visit effective programs so that local teams can see how programs work,

investigate how school youth feel about preparation for work, their aspirations and their goals,

re-examine systems of awards (marks, cups, emblems) regarding successful school work,

re-examine scheduling of students and courses to provide maximum flexibility,

develop strong programs of guidance including interpretation to parents,

re-examine vocational aspects of elementary programs and re-evaluate the role of the junior high school in occupational preparation,

re-evaluate teaching of the academic subjects (English, mathematics, reading, writing) as key vocational courses,

improve instruction in academic areas and relate them to vocational preparation,

assist professional growth of teachers in educating all youth,

examine relationship of school offerings to job opportunities on the local level and throughout the state.

Regional and state school leaders should —

foster workshops for principals and counselors regarding motivation and talents of students,

foster workshops for academic subject teachers regarding correlation of teaching with vocational preparation,

assist in the development of secondary curriculum programs on three levels of difficulty, with special attention to the low average student, the needs of girls,

assist in training local leaders to interpret to the community the new role of vocational education, to change the image of the "second class" school,

assist in the sharing of practices re: student selection, schedule flexibility, a series on "How We Did It" by experienced administrators,

re-examine state mandates such as teacher certification and preparation for emerging vocations,

assist in fostering needed legislation to enable all pupils to have equal opportunities,

foster regional cooperation with training programs of universities and training and research activities of industry to assure forefront thinking in vocational education.

Following Up The Outcomes Of The Conference By Its Sponsors

The Sponsors of the Conference pledge their cooperation in implementing in as many ways as possible the ideas and suggestions of the conference participants. Plans are underway for three specific actions during 1965.

The development of a publication showing a profile of the idea of area vocational-technical education. Such a pamphlet will show the relevance of general and vocational education to each other from kindergarten through the university, the institutional arrangements which foster such education, and techniques and methods used to establish such programs. The pamphlet will serve as a useful tool for communicating with various leadership groups.

Regional followup by the Department of Public Instruction with local school personnel regarding questions of local interest raised during the conference. Area coordinators of vocational-technical education plan to follow up questions of long range interest with local personnel. Through close cooperation local administrators can extend their horizons with local and regional planning.

A followup conference regarding the deeper meaning of vocational education, obstacles to progress, the continuity of education kindergarten through the university for the world of work, and leadership roles which facilitate opportunities for all youth.

How far will you cast your influence?

County Superintendents And Seminar Participants

NAME OF PARTICIPANT	POSITION	SCHOOL DISTRICT
William B. Herbein (Dr.)	Superintendent	Berks County
John W. Ebling	Principal	Hamburg Area Jt.
Laura L. Lannon (Mrs.)	Guidance Counselor	Kutztown Area
Leroy K. Lauck	Asst. Superintendent	Berks County
John H. Schrack	Guidance Counselor	Governor Mifflin Jt.
W. T. Shannon	Principal	Governor Mifflin Jt.
Jane M. Yoder (Mrs.)	Guidance Counselor	Hamburg Area Jt.
George E. Raab (Dr.)	Superintendent	Bucks County
Jacob Azain	Principal	Centennial Jt.
Orphia C. Chelland (Miss)	Guidance Counselor	Bensalem Twp.
M. Carlton Chew	Guidance Counselor	Neshaminy Jt.
Gerald E. Detwiler	Chairman, Dept. of Industrial Education	Central Bucks Jt.
Paul R. Detwiler	Guidance Counselor	Pennridge Jt.
James H. Fischer	Principal	New Hope-Solebury
Willard H. Fluck	Guidance Counselor	Palisades Jt.

Color Perception and Color Blindness. A Review of Selected Problems In Color Perception With Special Emphasis For School Personnel in Occupational Education.

New York State Education Dept., Albany. Office of Research and Evaluation

MF AVAILABLE IN VT-ERIC SET.

Pub Date - Nov67 15p.

*VISUALLY HANDICAPPED; *VOCATIONAL EDUCATION; VISUAL DISCRIMINATION; STUDENT CHARACTERISTICS; *STUDENT PROBLEMS; *STUDENT TESTING; AMETROPIA; EVALUATION CRITERIA; *OCCUPATIONAL GUIDANCE

Color discrimination problems of cosmetology students led to this review of selected medical literature dating from 1946 to 1965. The practical application of the findings to student screening and instruction in vocational education is stressed. Some findings from the literature were: (1) corrected astigmatism often improved color perception, (2) reasonably normal central vision is necessary for good color discrimination, (3) a lack of adequate accomodation may be significant for some with subtle, congenital color perception problems, (4) eight percent of white males have defective color vision, and (5) female carriers of color blindness may have abnormalities in color perception revealed by a sensitive test such as the Farnsworth-Munsell One Hundred Hue Test. It was recommended that all vocational teachers who teach subjects or safety where color is a key factor make a special effort to notice visual defects and make the appropriate referrals. Research variables which were suggested include age, the degree of visual acuity, the status of binocularity, the date and kind of latest correction, the age at which the first visual impairment was noticed, evidence of squinting, and the incidence of color blindness and refractive errors in the family. FOREWORD

With the increase of automation in industry, many of the occupational areas which formerly required workers able to make fine color discriminations no longer depend on the fallible human eye. Sorting, grading, and matching processes which involve color criteria are increasingly performed by machines.

However, there are certain occupations which still require human ability to discriminate among colors; designing and merchandising in such fields as textiles, interior decoration, and cosmetology, hair tinting, and makeup blending are illustrations. Perhaps most vitally in need of workers with good color discrimination are the fields of electrical and electronic equipment assembly and repair, where complex circuits are colorcoded for matching, and in the printing industries.

Color vision is a subject of some importance to occupational educators because students entering programs, and ultimately jobs, where accurate color discrimination is vital will be severely handicapped if they suffer from undiscovered defects in color perception. As early as 1946, a Report on Defective Colour Vision in Industry was issued by a committee of the Colour Group of the Physical Society of London, investigating the need for accuracy of color perception in various industrial jobs, and evaluating the tests available for determining defects.

This problem was discussed informally during the New York State Association of Vocational Industrial Education Organizations professional conference held in October, 1966, at Monticello, New York. At that time, a number of teachers and supervisors in secondary and adult cosmetology programs expressed an interest in research in this area to Dr. Alan Robertson, who was then Chief of the Bureau of Occupational Education Research.

It was observed, but without any formal validation, that students who seemed to have problems in color discrimination, color recognition, shade discrimination of the same color, etc., upon investigation also seemed to have often had case histories of astigmatism, both corrected and uncorrected. Students with this color perception and color matching problem seemed to be affected by the direction of the source of light hitting the object. In other words, if the light source struck the object directly, making an obtuse angle with the light reflected into the eye, a more acute problem seemed to arise than if the light struck the object from the rear of the student resulting in a more acute angle of incidence. Again, this was an observation without many cases and strictly theoretical.

A related problem, that of the measurement of variables in hue discrimination ability, had been discussed and developed in preliminary form in 1962 by Dr. Robertson and the late William A. Holst, Jr., Director of Technical Services, National Aniline Division, Allied Chemical and Dye Corporation; both experiences led to this investigation.

Accordingly, the Bureau of Occupational Education Research engaged G. Stewart Ray, M.D., Chief Resident in Ophthalmology at Albany Medical Center Hospital, to survey recent medical literature for studies linking vision defects and color perception. The Bureau also invited Dr. Ray's and his professional colleagues' opinions as to what in the theory of vision and the physiology of the eye might account for the empirically-observed connection between defects in vision and defects in color discrimination ability.

This report incorporates Dr. Ray's investigation and its application to the screening and instruction of students in industrial education program where skill in color perception and discrimination is called for. The theoretical and scholarly aspects of the subject have been subordinated to the practical applications.

The Office of Research and Evaluation is indebted to Leo V. Feichtner, M.D., Chief, and Mrs. Jane MacCallum, Assistant, Vision Conservation, Bureau of Health Service, State Education Department, for their review of this manuscript. We suggest to the reader that the Health Service Bureau publications, Testing the Vision of School Children, A Position Paper, and The School Eye Health Program, be consulted for the broader aspects of this color perception problem.

It is hoped that this report will assist vocational educators and guidance counselors in establishing one of many criteria in selecting students for vocational education programs, and suggest a possible cause of student low achievement in courses requiring color discrimination skills. Finally, this research survey illustrates that vocational classroom teachers, through reflection and observation, can be an important source of research stimulation and ideas which have practical application to program and instruction.

Alan G. Robertson, Director
Division of Evaluation

COLOR PERCEPTION AND COLOR BLINDNESS

Actually, "color blindness" is a misleading term. People with abnormal color perception are not truly blind to certain colors, in the sense that objects of those colors are invisible to them. Rather, the people whom we call "color blind" are suffering from defective color vision, the defect being that they cannot tell certain colors apart. In a relatively severe form of defective color vision, the subject will look at a red light and a green light and think that they are brown and gray or gray and gray-green respectively.

There are many degrees of impairment in color perception, ranging from monochromatism, which is seeing everything as nearly one color with differences only in brightness (similar to a black-and-white photograph), to very slight defects, such as anomalous trichromatism* which is usually the inability to differentiate hues that are close together on the spectrum--for example, shades of red and red-orange. A person with one of the mild varieties of color perception defect may never know it if he never has occasion to sharply discriminate among colors. An adult who consults an ophthalmologist for an eye examination may be astonished to be told that he has been going through life with defective color vision.

Refractive errors are the commonest visual defects, and are usually corrected by glasses. In the normal eye, parallel rays of entering light are refracted, or bent, by the lens and the other refracting media of the eye to focus at a point on the rear surface of the eyeball, the retina. The retina converts light energy into electrochemical messages which are sent to the brain and interpreted as the object seen.

Medical researchers have discovered high incidences of disturbed color vision accompanying uncorrected ametropia. Ametropia is the general name for

---

*See explanatory footnote in Appendix.

certain defects, including those commonly known as nearsightedness and farsightedness. Another form of ametropia, called astigmatism, is due to an uneven curvature in the surface of one of the refractive media of the eye, with the result that rays of light entering the eye will form a line of focus rather than a point of focus.

One study (Kyliev) showed that in some cases, a poor ability to differentiate colors with the uncorrected eye was improved when the subject wore spectacles for his near or farsightedness. The only explanations suggested for the beneficial effect that the refractive correction had upon color perception were that the generally diminished sharpness of the uncorrected vision impaired the patient's ability to distinguish color, and that the use of both eyes together improved color perception.

One medical study described the decrease of color sensitivity due to amblyopia of "squint" (Pagor). This type of amblyopia is dimness of vision without any detectable organic changes in the eye itself. It results from the disuse of an eye which is turned abnormally, as in "crossed eyes" or "wall-eyes", and customarily appears in young children. This serves to confirm the observations that reasonably normal central vision is necessary for good color discrimination. If vision is poor, enlarging the size of the colored test object will often allow accurate discrimination if the patient has a normal hereditary capability.

The color of light is determined by its wavelength. A pure color is composed of only one wave length, and therefore is called monochromatic. Light which contains more than one wavelength is polychromatic, as white light which contains the wave lengths of all the visible colors. In the normal eye, polychromatic light is slightly broken up when it passes through the refracting surfaces, so that images on the retina have fringes of color about them. This phenomenon is known as <u>chromatic aberration</u>.

In most cases, the aberration is never so significant as to be noticeable, except in such extraordinary circumstances as extreme dilation of the pupil or an extremely oblique angle of light entering the eye or the eyeglasses as observed by the cosmetology teachers who encouraged this study. However, these color fringes are involved in accommodation, or the automatic adjustment of the eye for seeing at different distances.

Certainly, the angle at which the light strikes the object is important in correct color perception. These circumstances raise the possibility of a significant relationship between the color of an object and the amount of the accommodation which is stimulated. Because clarity of vision is important in matching colors, and accommodation is important for seeing small objects at close range, a lack of adequate accommodation may be significant for some individuals with marginal vision, or subtle congenital color perception abnormalities. Unfortunately, no investigations are known which test this possibility.

An extremely complicated aspect of abnormal color perception is the heredity of "color blindness." It is well known that seven to eight percent of white males have defects in color vision. It is usually inherited by males through the mother, as a sex-linked characteristic. What is not so well known is that the female carriers of color blindness traits may be found to have abnormalities in color perception when tested properly by sensitive tests, although they themselves do not appear to be color blind.

Advances in the science of human genetics have shown that many hereditary diseases can exist in a lesser state among carriers; that is, carriers will actually have some degree of demonstrable abnormality in spite of outwardly normal function on gross tests or superficial observation.

In a 1964 study of 13 carriers (Krill and Schneiderman), all of whom showed entirely normal responses to the color charts used in the Ishihara

Pseudoisochromatic Test, it was found that 11 of the 13 had some degree of abnormality when tested by the more sensitive Farnsworth-Munsell One Hundred Hue Test.

External Illumination in Occupational Education

In planning certain vocational education classrooms and equipment, "correct" lighting for color perception is a must. The intensity of the light, the source of the light, and the angle from which it arrives at the eye from the illuminated object can markedly affect ability to discriminate colors. Wall colors are also important as they reflect light which is incident on the object.

The perception of color depends (partly) on a mechanism in the eye which does not function effectively below a certain intensity of light. After twilight, for example, objects appear to lose color and turn shades of gray. Blue and yellow hues in particular become much less distinguishable in decreased illumination. An individual's ability to distinguish colors may also be diminished when he views an object out of the side of his eye. The reason for this is that the color sensors are located mainly in the very center of the retina. The receptor cells in the retina function best when light strikes them parallel to their long axis, a situation impossible with oblique viewing.

The mixture of colors in a beam of white light has a major effect on the color of objects appearing in it. A bunch of buttercups in daylight appears yellow because the flowers absorb all but the yellow component of the light. In reflecting back the yellow to the eye, the flowers take on their characteristic hue. But if put in a pure blue light, with no yellow to reflect back, the flowers would appear to be black. Natural daylight contains all colors, and so reveals the true colors of objects; but certain kinds of artificial light lack some of the colors. Thus, the modern mercury-vapor streetlights will turn

reds to purples and greens to blues, and to a lesser extent blue-white flourescent tubes do the same thing. In vocational programs where color discrimination is a necessary skill, it is important not only that the human visual system be accurate in perceiving color, but also that external lighting conditions make it possible to discriminate colors accurately. Indeed, the flourescent light can cause some of the most annoying color differentiation problems in industry.

Safety Factors

On the job and in the school shop facility, an individual's inability to discriminate among colors and variations in color may constitute a potential health and safety hazard. Color code painting of live steam, gas, hot and cold water lines, and electrical conduits is a common practice, while color painting of walls, floors, and equipment to indicate hazardous areas is ineffective unless the colors are fully distinguishable to the worker or student. Failure to distinguish color codes and signal lights in production control may lead to waste and possible machine damage.

SUMMARY AND RECOMMENDATIONS

All this information can be of practical use to guidance counselors and vocational educators. Ordinarily, a counselor or teacher would not think of questioning a student's ability to distinguish colors if he does not show any marked abnormalities. But a student who expresses interest in an occupational field which requires accurate color discrimination may not be aware that he has defective color vision. Therefore, a teacher or counselor who observes the student to have one of the visual impairments (nearsightedness, astigmatism, poor accommodation, or monocular vision) often accompanied by a color perception defect should arrange to have the student's color vision tested very carefully since a slight color perception defect could radically affect his

success in the desired occupational program. Of course, accurate periodic testing of visual acuity for distance and nearness is a prerequisite of great importance.

Illustrative of other vocational education instructional programs, in addition to cosmetology, in which poor color discrimination may affect student performance, are the following:

(1) making up electrical harnesses using different colored wires of varying lengths

(2) wiring, according to color coded diagrams and prints, and inspecting or "trouble-shooting" hand wired and printed circuits

(3) ink matching in presswork, particularly browns and greens in general letter press, lithographic and color machine pressman training

(4) building trades instruction in painting, decorating, staining, terracotta, brick and stone masonry

(5) distributive education skills involving display work, stock buying, etc.

(6) raising of food, flower crops, and the identification of plant diseases and insect pests

(7) metal fabrication trades; a student with poor color perception may do such things as mix similar hardware items of different materials and consistently confuse nonferrous metals such as copper, brass, and phosphor bronze stocks until he observes their properties with cutting or forming tools or machines. This may also show up in the making of visual estimates of temperature in heat treatment processes by the color of the metal.

(8) commercial food preparation, apparel industries, and automotive trades such as body repair

Color vision testing should be conducted on each student interested in a vocational curriculum where accurate color discrimination is essential. Because of ease of administration and good reproductability, a properly administered Farnsworth D-15 screening test is recommended. (The H-R-R pseudoisochromatic test is slightly less desirable). If the D-15 indicates the possibility of defect, then the more time consuming but more quantitative and definitive Farnsworth-Munsell 100 hue test should be given. The results of such a test should be revealed to the prospective student.

Knowing that some color blind individuals learn to match materials using their reference colors, and since it has been empirically observed that individuals often do better in the shop than on the test, they should be advised as follows: "You appear to have a form of color blindness. Many people with this problem, however, are competent in jobs requiring color perception. If you are very eager to take a specific course, you will have to be prepared to change your plans if your color vision problem proves to be too much of a handicap." The student should be offered an alternative, but not initially directed to change his plans.

It goes without saying that counselors and advisors assisting youth and adults with occupational choices should carefully review all of the personnel requirements of these occupational fields and relate them to the physical, emotional, and aptitude characteristics of the counselee. The above situation applies especially to mild defects such as the anomalous trichromats. The more severe dichromats and the monochromats should be guided into a field which does not require precise color discrimination. Difficult or borderline cases should be referred to a specialist interested in the problems of color perception.

This investigation has established that abnormalities in color perception may be related to uncorrected refractive errors, to hereditary defects, both overt and occult, and to monocular as opposed to binocular vision. It also has established a relationship between good visual acuity and accurate color perception, especially for small objects. It has concluded that there are no adequate studies reported in the recent medical literature which can prove or disprove the empirical observations of the conditions which prompted this review. The most likely cause for these observations remains unsuspected, hereditary defects in color perception. Methods to separate these from other causes are available but complex.

To obtain further information on this subject it would be necessary to design a study that would minimize the number of variables involved, a difficult task because it is so hard to separate refractive errors from many of the other problems in the physiology of color vision that are poorly understood. There is little public consciousness of color vision problems--ophthalmologists observed that many patients are totally unaware that they have a defect in color vision until told of it--and even then for the most part it is the gross red-green defects that are discovered. Often this is due to inadequate testing, since the profession is not stimulated to test for this comparatively innocuous defect in an unselected population.

If it is decided to undertake a detailed study of the problem, a questionnaire should be designed for students who evidence any significant abnormalities in color perception. Information about personal and family history should be supplied for analytic investigation, including at least the following:

(a) age

(b) degree of visual acuity with and without correction at a distance and at close range

(c) status of binocularity

(d) most recent correction and date

(e) age at which any visual impairment was first noticed

(f) any previous history of squinting

(g) incidence of color blindness and refractive errors in the family

Teachers who have observed problems of color perception in their students are encouraged to report them to:

Dr. Alan G. Robertson, Director
Division of Evaluation
State Education Department
Albany, New York 12224

APPENDIX

*The terms mono-, di-, and trichromat refer to the results obtained on a special test for color vision. The machine used is called an anomaloscope and has three knobs, one for controlling the intensity of each of the three primary stimuli--red, green, and blue. An anomalous trichromat uses all three of the knobs to match a standard color but in different relative intensities than the normal. Normals use all three dials and are therefore "normal trichromats." The dichromat (who has a more severe defect) uses only two of the color intensity control knobs to attain his match. He does not use the color to which he is insensitive. The monochromat "matches" colors using only brightness and therefore uses only one of the knobs. It is important to realize that when we say that the subject makes a "match" of the colors we are talking about his subjective sensation that he has made one color as nearly identical to the standard as possible. The results of the test are taken from the readings on the dials of the anomaloscope and what the patient calls the color is of no significance.

Public Health Service Grants for Training Projects, Policy Statement.

Public Health Service, Washington, D.C. Publication 1302
MF AVAILABLE IN VT-ERIC SET.
Division of Research Grants, Public Health Service, Bethesda, Maryland 20014.
Pub Date - 1Jul67 49p.

*HEALTH OCCUPATIONS EDUCATION; *FEDERAL AID; *ADMINISTRATIVE POLICY; RESPONSIBILITY; PROGRAM BUDGETING; *EDUCATIONAL PROGRAMS; FINANCIAL POLICY; *STANDARDS; STUDENT SELECTION

The statement is intended to cover all Public Health Service training grants to non-profit institutions for establishing, expanding, or improving training opportunities for individuals interested in careers in the health sciences and related fields. Grantee responsibilities are explained generally and in relation to civil rights legislation, patents and inventions, copyright, investigations involving human subjects, animal procurement and care, and conflict of interest. Policies and forms of funding are discussed. Policies governing project changes are presented in relation to changes in project period, training objectives, and grantee institution, as well as temporary absence and withdrawal of the project director. Policies with regard to trainees relate to eligibility, citizenship, terms of appointment, support, concurrent awards, holidays and vacations, obligations to the Public Health Service, and services required. Other policies presented govern the publication of project information, direct and indirect costs, rebudgeting of funds, refunds, and accounting. A section on reports discusses the statement of trainee appointment, report of expenditures, progress reports, and invention reports. A listing of related public health service documents and guides is included. (JK)

DISCRIMINATION PROHIBITED—Title VI of the Civil Rights Act of 1964 states: "No person in the United States shall, on the ground of race, color, or national origin, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any program or activity receiving Federal financial assistance." Therefore, the grant and award programs of the Public Health Service, like every program or activity receiving financial assistance from the Department of Health, Education, and Welfare, must be operated in compliance with this law.

PREFACE

The reorganization of the Public Health Service, effective January 1, 1967, assigns to the Office of the Surgeon General additional central responsibilities for management of grant and contract activities. The reorganization also realigns the past Bureau structure of the Public Health Service to fulfill a changed Federal role in meeting the Nation's changing health needs. Under the new plan, five Bureaus, the National Library of Medicine, and the Office of Comprehensive Health Planning and Development will have responsibility for financing training grants to support training conducted in facilities located in the United States and in several foreign countries. The respective components that will be concerned with grant activities are shown below.

BUREAU OF DISEASE PREVENTION AND ENVIRONMENTAL CONTROL

- National Center for Air Pollution Control
- National Center for Chronic Disease Control
- National Communicable Disease Center
- National Center for Radiological Health
- National Center for Urban and Industrial Health

BUREAU OF HEALTH MANPOWER

- Division of Allied Health Manpower
- Division of Dental Health
- Division of Health Manpower Educational Services
- Division of Nursing

OFFICE OF COMPREHENSIVE HEALTH PLANNING AND DEVELOPMENT

The Office of Extramural Programs in the Office of the Surgeon General is the principal staff advisor to the Surgeon General on administrative policies governing all extramural programs, including the development and issuance of policies governing the training grant programs.

This Policy Statement is the source of the basic policy requirements under which all Public Health Service training grants are administered.

Under the terms of a training grant, the institution and the program director enter into a special relationship with the Public Health Service for the utilization of grant funds. This relationship results from the basic nature of the grant as a conditional gift in response to a request for support of a project in which there is a substantial measure of public interest. A grant, therefore, represents a mutual joining of interests on the part of the grantor and the grantee in the pursuit of a common objective. In this relationship, the grantee assumes with the grantor the obligation to act in the public interest in achieving a common purpose. This is a relationship of trust which imposes upon the grantee the responsibility to assure that the grant funds are utilized for the purpose for which they were awarded, and to exercise the same probity and prudence in their expenditure that is extended to the use of the grantee's own funds.

These are the broad obligations that a recipient of a Public Health Service training grant accepts. This Policy Statement is not intended to specify the full extent of the considerations that engage the grantee. The Public Health Service is also concerned with assessing the adequacy of administrative practices and the prudence exercised by the grantee to assure conformity with the terms of this Policy Statement. Examination of the administrative processes utilized in the expenditure of grant funds is a continuing responsibility of the Public Health Service in the administration of these programs.

This Policy Statement pertains only to grants for training projects and is effective for all actions on and after July 1, 1967. It supersedes the previous Statement dated July 1, 1965. Separate policy statements deal with other grant and award programs of the Public Health Service and are available upon request.

Statement of Policy

GRANTS FOR TRAINING PROJECTS

Purpose and Scope

The Public Health Service provides support, through training grants, to assist public and other nonprofit institutions in establishing, expanding, or improving training opportunities for individuals interested in careers in research, teaching, administration, and services in the health sciences and related fields.

This general policy statement is intended to cover all Public Health Service training grant programs. For certain programs additional policy and program statements will be issued by individual awarding organizational units of the Public Health Service (Bureaus, Institutes, Divisions, Centers, and offices of the Public Health Service).* These individual statements will not repeat items contained in this Statement of Policy; rather, they will specify any variations from policies stated herein and any additional program requirements.

While the details of the review process for training grant applications may vary with statutory requirements and with specific procedures of the awarding units, the recommendations are based on assessment of the application from standpoints of merit, training capability, program relevance, and consonance with public policy.

To facilitate the review process in most areas of training, the Public Health Service utilizes panels of qualified individuals recruited from universities and other public

*Hereinafter referred to as awarding units.

264-144 O - 67 - 2

and nonprofit institutions to advise on the merit of proposals.

The award of grants and the administration of grant funds are subject to the applicable provisions of basic statutory authorities, appropriation acts, and pertinent Public Health Service regulations. It is not the purpose of this document to summarize or restate these requirements, but to delineate the operating policies which govern the administration of training grant programs by the awarding units of the Public Health Service.

To facilitate understanding of this policy statement, certain key words are defined below.

Grantee (*Applicant institution*)—that institution or organization which is awarded funds on the basis of an approved application, and which assumes legal and financial responsibility and accountability for use and disposition thereof.

Program director—the individual designated by the grantee and approved by the Public Health Service to be responsible for the conduct of the training project.

Trainee—an individual who receives financial support for training (stipend, dependency allowance, tuition, or travel) from a Public Health Service training grant.

Project—the identified training activity approved for support by the awarding unit.

Project period—the time, not exceeding 7 years, for which support for a project has been approved for payment.

Budget—the amount of funds approved by the awarding unit for services, materials, trainee expenses, and other items.

Budget period—the interval of time (usually 12 months) into which the project period is divided for budgetary purposes. Applications, notices of grant awarded, and reports of expenditures are prepared on this basis.

Grant—an award of funds based on an approved budget in support of a project and awarded for the remaining project period.

Prior approval—written permission by the awarding unit of the Public Health Service to use grant funds for certain purposes not included in the approved budget. The request for such approval must be initiated by the program director, signed by an authorized institution official, and approved by the awarding unit before the performance of the act which requires the expenditure of funds.

GRANTEE RESPONSIBILITIES

In applying for a training grant the applicant institution agrees to administer the grant in accordance with the governing Public Health Service regulations and policies in effect at the time of award. Where the grantee has a policy not covered by Public Health Service policy, or where the grantee policy is more restrictive than Public Health Service policy, the grantee policy prevails. Administration of a grant-supported training project is a joint undertaking by the grantee and the program director. The grantee assumes responsibility for fiscal and administrative management and fulfillment of any special conditions which may be prescribed for the conduct of the project. The program director and the grantee share responsibility for the conduct of the training and for using grant funds prudently for the purposes set forth in the approved application and notice of grant awarded.

Civil Rights

Public Health Service grants and awards must be administered in conformance with the Civil Rights Act of 1964; the regulation (45 CFR, Part 80) issued pursuant thereto by the Department of Health, Edu-

cation, and Welfare; and the grantee's Assurance of Compliance (Form HEW–441) on file with the Public Health Service.

Patents and Inventions

Policy

In accordance with Department of Health, Education, and Welfare Regulations (45 CFR, Subtitle A, Parts 6 and 8), all inventions made in the course of, or under, any Public Health Service grant shall be promptly and fully reported to the Assistant Secretary (Health and Scientific Affairs), Department of Health, Education, and Welfare.

The grantee and the program director shall neither have nor make any commitments or obligations which conflict with the requirements of this policy.

Determination

Determination as to ownership and disposition of invention rights, including the determination of whether a patent application shall be filed, and if so, the manner of obtaining, administering, and disposing of rights under any patent application or patent which may issue, shall be made either:

a. By the Assistant Secretary (Health and Scientific Affairs), whose decision shall be considered as final, or

b. By the grantee, in accordance with an existing formal institutional agreement with the Public Health Service or the Department.

Patent applications shall not be filed on inventions under (a) above without prior written consent of the Assistant Secretary (Health and Scientific Affairs), or his representative. Any patent application filed by the grantee on an invention made in the course of, or under, a Public Health Service

grant shall include the following statement in the first paragraph of the specification:

> "The invention described herein was made in the course of, or under, a grant from the U.S. Public Health Service, Department of Health, Education, and Welfare."

Reports and Other Requirements

A complete written disclosure of each invention in the form specified by the Assistant Secretary (Health and Scientific Affairs) shall be made by the grantee promptly after conception or first actual reduction to practice, and, in any event, prior to publication. Upon request, the grantee shall furnish such duly executed instruments (prepared by the Government) and such other papers as are deemed necessary to vest in the Goverment the rights reserved to it under this policy statement to enable the Government to apply for and prosecute any patent application, in any country, covering each invention where the Government has the right to file such application.

The grantee shall furnish interim reports (annual invention statements) prior to the continuation of any grant, listing all inventions made during the budget period, whether or not previously reported, or certifying that no inventions were made during the applicable period. Upon completion of the project period, the grantee shall furnish a final invention report, listing all inventions made during performance of work on the supported project or certifying that no inventions were made during that work.

Supplementary Patent Agreements

The grantee shall obtain appropriate patent agreements to fulfill the requirements of this provision from all persons who perform any part of the work under the grant, except such clerical and manual labor personnel as will have no access to

technical data, and except as otherwise authorized in writing by the Department.

The grantee shall insert in each subcontract or agreement having experimental, developmental, or research work as one of its purposes, a clause making this provision applicable to the subcontractor and its employees. Agreements shall also be obtained by the grantee to govern disposition of rights to inventions resulting from screening of compounds synthesized under the grant.

Definitions Relating to Patent Matters

As used in this provision, the stated terms relating to patent matters are defined as follows for the purposes hereof:

1. "Invention" or "invention or discovery" includes any art, machine, manufacture, design, or composition of matter, or any new and useful improvement thereof, or any variety of plant, which is or may be patentable under the Patent Laws of the United States.

2. "Made" when used in relation to any invention or discovery means the conception or first actual reduction to practice of such invention in the course of the grant.

Copyright

Except as otherwise provided in the conditions of the award, when publications, films, or similar materials are developed from work supported by the Public Health Service, the author is free to arrange for copyright without approval. Any such copyrighted materials shall be subject to a royalty-free, nonexclusive, and irrevocable license to the Government to reproduce them, translate them, publish them, use and dispose of them, and to authorize others to do so.

Investigations Involving Human Subjects, Including Clinical and Behavioral Sciences Research

Safeguarding the rights and welfare of human subjects involved in investigations supported by Public Health Service grants or awards is the responsibility of the grantee. This responsibility includes assurance of adherence to the laws of the community in which the investigations are conducted and due consideration to pertinent ethical issues. Appropriate groups of associates within the institution, and outside consultants if needed, are to be utilized to provide the necessary review. Grantees may designate separate groups in order to assure competence and independence of review for particular areas.

The grantee is responsible for the clarification and resolution of all ethical and other pertinent issues. The appropriate mechanism for this purpose is the utilization of groups of associates established at the institution to provide competent, independent review. Based on its knowledgeable scrutiny of the specifics of the investigation involved, such a review group shall decide which issues are germane and, where they are germane, ascertain the adequacy of provisions for protecting the rights and welfare of human subjects, the appropriateness of the methods used to secure informed consent, and the risks and potential benefits of the investigation.

No application for support of investigations involving human subjects will be accepted for review unless an institution-wide assurance has been accepted from the applicant institution. More detailed information concerning investigations involving human subjects and assurances is provided in the Surgeon General's memoranda of July 1, 1966, December 12, 1966, and January 24, 1967 (see Related Public Health Service Documents and Guides, page 40).

Animal Procurement and Care

It is the responsibility of each person assigned or appointed to a project receiving Public Health Service support to exercise every precaution to assure proper care and humane treatment of animals, with particular reference to Public Law 89–544 and to criteria established in the "Guide for Laboratory Animal Facilities and Care."

Conflict of Interest

Each grantee receiving Public Health Service training grant funds is urged to have written guides for staff members (administrators, faculty members, professional staff, or employees) which explain the conditions under which outside activities are proper and which require notification of such activities to a responsible representative of the institution.

FUNDING

Funding of an approved project includes a determination of support for the authorized project period. Grants to support the project are made on a budget period basis subject to the appropriation of funds by the Congress. The initial grant reflects the determination of funds approved for the conduct of the project for the first budget period (usually 12 months), but the funds are made available for the full project period. The notice of grant awarded indicates the allocation of Public Health Service funds by budget categories, the additional support recommended and expected to be made available for the remainder of the project period, and any special conditions which attend the award.

Continuation Support

Funds for subsequent years within the project period must be requested on the application form for continuation support, which is routinely mailed to the program director well in advance of the beginning

date of the next budget period. It is the responsibility of the program director to request this application form if it has not been received. The level of funding for the ensuing grant period will be determined from review of the application within the framework of the support previously recommended for the remainder of the project period. The award may include funds in the amount of an approved budget, or funds to be added to those funds remaining from a previous grant to provide an amount equal to the approved budget. (Separate procedures govern the use of Health Professions Basic Educational Improvement grants.)

Supplemental Funds

If additional funds to conduct the project are required within any portion of the project period over those budgeted and approved and such funds are not available within the institution receiving support for the project, a supplemental request may be submitted. If awarded, the additional amount becomes a part of the grant to which it is a supplement.

1. Expansion funds: Supplemental applications for expansion of a project are subject to the same deadlines and processed in the same manner as new applications and must compete for available funds.

2. Administrative increases: Requests for supplemental funds to meet impending increased administrative costs, such as fringe benefits or institution-wide or other salary increases, may be included in the application for continuation support. Administrative increases which take effect during a current budget period may be requested in a letter, signed by an authorized institution official. A supplemental *research* training grant, however, will not be made for administrative increases which take effect during a current budget period when the organizational component where

264-144 O - 67 - 3

the project is located is receiving a General Research Support or Biomedical Sciences Support grant from the Public Health Service.

Renewal of Support Beyond the Project Period

If additional support is desired to continue the project beyond the approved project period, an application for renewal must be submitted in accordance with the deadline dates and accompanying instructions. This application will be reviewed in the same manner as a new application and will compete for available funds with other applications. If approved and awarded, an initial grant for a new project period will be made.

Early Termination of Grants

By the Grantee.—A grant may be terminated or canceled at any time by the grantee upon written notification to the awarding unit.

By the Public Health Service.—A grant may be revoked or terminated at any time within the project period whenever it is determined by the Surgeon General of the Public Health Service that the grantee has failed to comply with the terms and conditions of the grant.

Upon any early termination, the grantee shall submit a report of expenditures. If in the judgment of the Surgeon General the termination is due to no fault of the grantee, credit shall be allowed for the amount required to settle at minimum costs any noncancellable obligations properly incurred by the grantee prior to receipt of notice of termination.

Reports Required Upon Early Termination.—When early termination occurs, a progress report (see page 38), a report of expenditures, and an annual invention statement must be submitted.

PROJECT CHANGES

Change in Project Period

Where additional time is required to assure adequate completion of a project, the project period may be extended up to 12 months if requested by the grantee before the end of the project period and approved by the awarding unit. In no event, however, shall the project period exceed 7 years.

Change in Training Objectives

Prior written approval of the awarding unit is required when the grantee wishes to make changes which would alter the approved objectives for which the grant was made.

Temporary Absence of Program Director

Where absence of the program director is anticipated to exceed 3 months, plans for the conduct of the project during his absence, including designation of the acting program director, must be approved by the awarding unit. A request for such approval must be signed by an administrative official of the institution and submitted as soon as it is known that he will be absent.

Withdrawal of Program Director

If the program director relinquishes or expects to relinquish active direction of the project, the awarding unit must be notified immediately. The grantee may request that the grant be terminated, in which case a terminal progress report, a report of expenditures, and a final invention statement must be submitted. The grantee may request that the project be continued under the direction of another program director. A biographical sketch describing his qualifications should be submitted to the awarding unit for reevaluation of the project in the light of the change.

Change of Grantee Institution

Training grants may not be transferred from one institution to another.

TRAINEES

The following statements are applicable to training grants that are activated July 1, 1967, and thereafter:

Eligibility

Trainees to be supported under a grant must meet the general eligibility requirements set by the awarding unit for that particular program. Also, they must meet any additional institution requirements set by the grantee.

Grant funds may not be used (*a*) for the support (stipend, tuition, or travel) of any trainee for whom a statement of appointment has not been submitted to the awarding unit; (*b*) for the support of any trainee who because of age, physical or mental condition, or other relevant factor, would not in the judgment of the program director be able to use the training or meet the institution's minimum qualifications for the training involved in the project; (*c*) for the continuation support of a trainee who has failed to demonstrate satisfactory participation; (*d*) for support of candidates for degrees of M.D., D.D.S., D.O., D.V.M., or similar degrees, except as provided under *Stipend Allowance* (*Medical and Other Health Professions Students,* see page 14) and *Tuition and Fee Allowance* (see page 17); or (*e*) for residency training, unless specifically approved by the Surgeon General and announced by the awarding unit.

Citizenship

Trainees who are United States citizens or nationals and trainees who are foreign nationals lawfully admitted to the United States for permanent residence may be appointed by the grantee without prior approval by the Public Health Service. Foreign nationals admitted to the United States on a visa for temporary residence may be appointed as trainees by the grantee only with prior approval of the awarding

unit. Only United States nationals may receive stipends from grants to foreign institutions.

Trainee Appointments

An appointment or a reappointment may not exceed 12 months without prior approval by the awarding unit. The amount of the stipend, dependency allowance, and tuition for each full period of appointment must be obligated from funds available at the time the individual begins his training unless other instructions are furnished by the awarding unit.

A new appointment is the first appointment for a trainee. A reappointment is a subsequent appointment for the same trainee under the same project.

A statement of appointment of trainee must be submitted to the awarding unit for each appointment or reappointment of a trainee receiving stipend, tuition costs, or travel expenses from a Public Health Service training grant. For each appointment, or reappointment, the statement must be submitted at the time the training period of the individual begins.

If there are changes in the terms of the appointment, an amended appointment statement is required.

Support

Unless other rates have been approved for a particular program of the Public Health Service and announced by the awarding unit concerned, stipends and allowances paid from Public Health Service training grant funds may not exceed the following established rates for a 12-month period of training. Trainees appointed for shorter training periods will be supported at the appropriate stipend level on a pro rata basis. Trainees at the same level of education and training should receive comparable stipends.

Support of a full-time Federal employee as a trainee is allowable only when the em-

ployee is (*a*) on leave without pay and (*b*) reimbursement is in accordance with terms mutually acceptable to the Federal Government agency and to the awarding unit.

Stipend Allowance

Predoctoral Level.—Requirements:

Bachelor's degree or equivalent training

Stipends:	First year	$2,400
	Second year	$2,600
	Third and subsequent years	$2,800

Postdoctoral Level.—Requirements:

Doctor's degree or equivalent training

Stipends:	With no relevant postdoctoral experience	$6,000
	With 1 year of relevant postdoctoral experience	$6,500
	With 2 or more years of relevant experience	$7,000

Special Stipends.—The amounts for special stips (including allowances) are to be determined on an individual basis between the program director and the awarding unit.

Medical and Other Health Professions Students.—Institutions that have established stipend levels applicable to medical and other health professions students for summer and "off quarter" training that have been approved by the awarding unit may pay stipends to these students without reference to above rates established for predoctoral trainees. Those institutions that do not have applicable stipend schedules will observe the above listed predoctoral rates on a pro rata basis or will observe rates established by the Public Health Service for particular programs.

Supplementation

As used in all Public Health Service policy statements and procedural guides dealing with training stipends, "supplementation" means the provision of funds by a *grantee* to a trainee *in addition* to his grant-supported stipend, in a combination

which then exceeds established Public Health Service stipend ceilings.

Trainees are expected to devote their entire professional effort to the achievement of their training objectives. Unless otherwise indicated by the Public Health Service awarding unit, the grantee may not provide funds to trainees for any reason, including employment, where the combination of such funds and the Public Health Service stipend exceeds established Public Health Service stipend ceilings. Loans are excluded from this general prohibition and special conditions for supplementation are applicable at the predoctoral level as indicated below.

Predoctoral Level.—Institutions may supplement the stipend of a predoctoral trainee only if all of the following conditions are met:

1. No *services* are to be required of the trainee in order to receive the supplemental funds.
2. The source of funds for supplementation must be non-Federal, except that Public Health Service General Research Support or Biomedical Sciences Support grants may be used for this purpose.
3. The decision to supplement the stipend of a predoctoral trainee must be made at the institution level, rather than at any lower level. Records indicating names, amounts, dates, and reasons for supplementation must be maintained by the institution and made available upon request from the awarding unit.

Under no circumstances may supplementation be used for purposes of recruitment.

No more than $1,000 per 12-month period (prorated for shorter periods) may be provided as supplementation without prior Public Health Service approval.

Postdoctoral Level.—No supplementation is permitted.

(Not applicable to residency and postresidency training programs. In those programs where residency training is supported, the supplementation policy for these programs will be determined by the individual Bureaus of the Public Health Service.)

Dependency Allowance

Dependency allowances may be awarded for trainees at predoctoral and postdoctoral levels in the amount of $500 for a dependent spouse, each dependent child, and each dependent relative, provided that during the trainee appointment the dependent receives more than one-half of total support from the trainee. A dependency allowance may *not* be claimed for any person who during the trainee's appointment period will be receiving a fellowship or traineeship stipend under any U.S. Government educational assistance program (other than loans), or for whom an allowance will be made as a dependent of any other person during that period.

Travel Allowance for Trainees

To the Training Institution.—The cost of the trainee's travel to the training institution may be allowed only for the purpose of, and at the time of, entering the training program. The allowance is payable only once to any one trainee from any one training project.

A travel allowance of 8 cents per mile, as computed by standard mileage charts, may be paid from grant funds for travel to the training institution from the trainee's last place of residence prior to the beginning of his training. In the case of individuals whose last place of residence is outside the United States, as defined under domestic travel (see page 31), travel may be paid only from the port of entry into the United States.

No allowance is made for (*a*) per diem expenses during travel, (*b*) travel at conclusion of training, (*c*) travel distances of less than 50 miles, (*d*) transportation of dependents, or (*e*) shipment of personal effects or household goods.

The policy governing the use of funds for travel relating to short-term training—less than a normal academic period—will be as provided by the awarding units. Grantees are responsible for ascertaining the policy on this matter before charging such expenditures to grant funds.

Travel During Period of Training.—Grant funds may be used for transportation and per diem for travel of trainees during the period of the grant when included in the terms of the original award or with prior approval. The rate of per diem or other allowance and the type of travel accommodations shall be in accordance with institution policy. (See *Travel*, page 32.) Such travel and per diem costs are payable only to full-time trainees who have received formal appointments and for whom the statements of appointment have been forwarded to the awarding unit.

Foreign Travel.—The grantee should contact the particular awarding unit regarding provisions which apply.

Tuition and Fee Allowance

When allowable, only the same resident or nonresident tuition and fees charged to regularly enrolled non-Federally supported students may be charged for trainees. Instructions of certain programs show that tuition and fees may be paid only for trainees receiving a stipend from a Public Health Service grant.

Tuition and fees for courses which satisfy requirements related exclusively to the M.D., D.D.S., D.O., D.V.M., or similar degrees may not be charged to a grant. (Not applicable to the Medical Scientist Training Program of the National Institute of

General Medical Sciences, or the Experimental Training Grant Program of the National Institute of Arthritis and Metabolic Diseases.) When the courses are creditable to satisfying Ph. D. degree requirements in combination with any of the aforementioned degree requirements, however, tuition and fees may be charged for those courses within the combined degree program that are required specifically for the attainment of the Ph. D. degree.

Concurrent Awards

Stipends under Public Health Service training grants may not be received concurrently with any other Federal educational award (fellowship stipend, traineeship stipend, Educational Assistance under Veterans' Readjustment Benefits Act of 1966 (P.L. 89–358), or similar award). Loans from Federal funds are not considered Federal awards.

Holidays and Vacations

Trainees in academic institutions are not entitled to vacations as such. They are, however, entitled to the normal short student holidays observed by their training institutions.

Trainees in nonacademic institutions are entitled to the holiday and vacation schedule applicable to all trainees at the institution.

Additional payment for leave not taken may not be claimed.

Obligations of Trainees to the Public Health Service

Trainees are not required to work for the Public Health Service at the conclusion of their training. Conversely, the Public Health Service assumes no responsibility for employing or placing such persons.

Services Required

Trainees receiving full-time support from a Public Health Service grant shall

not be required to perform any work which is not an integral part of the training project.

PUBLICATION AND PUBLICITY

Reporting Project Accomplishments

Program directors are encouraged to make the results and accomplishments of their activities available to the public. Since prior Public Health Service approval is not required for reporting the results of any activity under a training grant, responsibility for direction of the activity should not be ascribed to the Public Health Service. Acknowledgment of Public Health Service support must, however, carry the following or comparable footnote:

> "This investigation was supported by PHS Training Grant No. ..... from ....."
> (awarding unit).

Surveys and questionnaires must include a positive statement clearly setting forth that the contents are in no way the responsibility of the Public Health Service.

In the event that the institution wishes to join with the Public Health Service in a simultaneous news release announcing the results of a project, the information officer of the awarding unit will carry out the necessary coordination.

Six reprints of publications resulting from work supported in whole or in part by a Public Health Service grant must be submitted to the awarding unit.

Release of Information by the Public Health Service

Public Health Service policy requires that certain information requested on individual training grants shall be released to recognized information media and—to

the extent that the Public Health Service deems it appropriate—to an individual member of the public.

Pending Applications

An application for training grant support is considered privileged information. Until such time as an application is approved and a grant awarded, no information is disclosed.

Grant Awards

The Public Health Service makes available each year to members of the press and other interested persons a report listing the training projects awarded in the preceding fiscal year. Information made available includes the title or area of training of the project, name and institution affiliation of the program director, and amount of the award. In addition to the annual listing, the following information is available upon request:

1. A general description of the approved project.
2. The approved budget as shown in the notice of grant awarded.
3. Details of grant expenditures in total sums only for each major category of expenditures.
4. Information describing the nature of the training project may be obtained from the Science Information Exchange, 1730 M Street NW., Washington, D.C. 20036.

Information Not To Be Released

1. Details of estimated budgets or of actual expenditures.
2. Any reports unless specifically agreed to by the program director and the grantee.
3. Discussions of applications by advisory bodies.

COSTS

Unless otherwise indicated in the notice of grant awarded, allowable costs are those permitted under this policy statement, applicable Public Health Service regulations, special instructions by the awarding units, and Bureau of the Budget Circular A–21 (or other appropriate cost principles current at the time of award). The cost of a training project comprises the allowable direct cost expenditures incident to its performance, plus the allocable portion of allowable indirect cost of the institution. (Provisions of authorizing legislation or applicable regulations prohibit the payment of an indirect cost allowance for some grant programs.)

Expenditures must be accorded consistent treatment, including the allocation between direct and indirect costs, through application of established institution policies and practices applicable to all work of the institution for purposes of cost finding.

Within the limits of allowable costs and the total direct cost budget approved by the Public Health Service, the grantee may charge Public Health Service grant funds only for expenditures which are required to carry out the approved project.

Costs incurred by a cooperating or affiliated organization of the grantee, which are otherwise allowable, may be charged to the grant account only to the extent that the grantee has actually paid for such costs. Thus, when a university is the grantee and costs are incurred by an affiliated hospital, the university must reimburse the hospital for such costs if they are charged to Public Health Service grant funds.

Direct Cost Expenditures Other Than Trainee Costs

Prior written approval by the Public Health Service is required for certain items and for transfer of funds between certain

categories of cost, as indicated in the list below. Restricted direct cost categories of the budget may be decreased, unless otherwise indicated, but not increased without prior approval. In all other respects, the grantee may transfer funds from one category of direct cost to another. The inclusion of a specific description of the proposed item or cost category and the proposed amount in the grant application, followed by receipt of the notice of grant awarded containing no exception, constitutes prior approval. When a subsequent need arises for an item requiring prior approval or for an increase in a restricted cost category, the request for approval must be initiated by the program director and must be signed by an authorized institution official.

The list below includes allowable and unallowable expenditures most frequently encountered as direct costs in connection with training grants. Failure to mention a particular item of cost is not intended to imply that it is either allowable or unallowable as a direct cost; rather, determination as to allowability in each case shall be based on the treatment or standards provided for similar or related items in accordance with the institution's policies and procedures.

Alterations and Renovations.—Allowable to provide modifications necessary for the training project provided that (*a*) the aggregate cost to the Public Health Service of any single alteration and renovation project does not exceed $50,000, regardless of the number of years over which the funds might be needed or the number of separate grants into which such costs might be spread; (*b*) the grantee is not a foreign institution; (*c*) the structure was not constructed, remodeled, or equipped with other Public Health Service funds within the preceding 6 months; and (*d*)

prior Public Health Service approval has been obtained for any charge during a budget period for alterations and renovations in excess of $250.

If grant funds are to be used to pay any part of the cost of any contract for alterations and renovations where the total contract exceeds $10,000, the grantee must agree to the conditions in the Equal Employment Opportunity Statement required under Executive Order 11246.

Animals.—Charges for the acquisition, care, and use of experimental animals are allowable.

Bonus Payments.—Not allowable.

Books and Periodicals.—Allowable where required for the conduct of the project.

Communications.—Extraordinary or unusual costs resulting from local and long distance telephone calls, telephone surveys, telegrams, postage, etc., necessary to the project, and not treated as indirect costs, are allowable.

Construction of Buildings (Including Additions or Extensions).—Not allowable.

Consultant Services (Fees and Supporting Costs).—Allowable except that a consultant fee may not be paid to (*a*) an individual otherwise employed by the grantee except in unusual circumstances and with prior Public Health Service approval, or (*b*) a U.S. Government employee.

Contingency Funds or Reserves.—Not allowable.

Contracts for Services.—Allowable. (Note requirements relating to Patents and Inventions, page 4; Civil Rights, page 3; and *Alterations and Renovations,* page 22.)

Customs and Import Duties.—Allowable, except for grants made to foreign institutions.

Dependency Allowance (Trainees).—See page 16.

Depreciation or Use Allowance.—Not allowable for real or personal property (buildings and equipment). This restriction does not apply to centralized facilities operated by the grantee, such as computer centers or motor pools, providing the charge is applied proportionately to all users and is designed to recover only actual costs. (See *Rental of Space,* page 28.)

Donors.—Payments to individuals who contribute blood, urine samples, and other body fluids or tissues used for the project are allowable.

Drugs.—Allowable. Grantees are encouraged to purchase drugs under their nonproprietary names whenever practicable.

Dues.—Not allowable except when incurred because membership in professional organizations or societies is required to obtain publications necessary to the project.

Entertainment.—Costs of amusement, social activities, entertainment, and incidental costs related thereto, are not allowable.

Equipment.—Allowable. Prior Public Health Service approval is required for (*a*) items over $1,000; (*b*) printing equipment; and (*c*) equipping offices, conference rooms, and similar space.

Equipment may be rented but not purchased from grants in support of conferences. (See *Equipment Rental,* page 25.)

A grantee may be reimbursed for an item of equipment already owned by the institution only when it is in the institution's central purchasing department and held in a central stockroom for issuance and sale to a using activity.

For purposes of charging Public Health Service grants, the cost of a single unit or piece of equipment includes necessary accessories, duty, excise, and sales taxes (unless the institution is exempt from such taxes). If the institution policy provides

that charges for transportation, protective in-transit insurance, and installation are a part of the cost of equipment, such charges must be included in the equipment costs if they are to be charged to Public Health Service grants.

Equipment Maintenance and Repairs.—Allowable on equipment used on the Public Health Service supported project.

Equipment Rental.—Allowable provided the equipment is not owned by the grantee. Rental charges to a grant must be made in conformance with institution policies and in the same manner that similar charges are made to any account.

Equipment—Federal Surplus and Excess Property.—Costs are allowable for acquiring surplus property through the Surplus Property Utilization program. Such acquisition is encouraged in order to conserve public funds. For information, contact Regional Representative, Division of Surplus Property Utilization, Department of Health, Education, and Welfare, or the State Agency for Surplus Property.

Transfer to the grantee of property excess to the needs of the Public Health Service, not declared "surplus," is not permitted.

Equipment—Foreign Grants.—Single items of equipment costing $2,000 or more (excluding transportation, delivery, and installation charges) purchased by foreign grantees must be of United States manufacture unless prior Public Health Service approval is obtained.

Federal (U.S. Government) Employees.—The following rules apply to payments made to full-time Federal employees:

Consultant Fees.—Not allowable.

Outpatient or Subject Costs.—Allowable when employee is a patient or subject

70

undergoing study in connection with the training project supported by the grant.

Salaries.—Allowable only when employee is on leave without pay and reimbursement is in accordance with terms mutually acceptable to his Federal Government agency and to the awarding unit concerned.

Support of Federal Employees as Trainee.—See page 13.

Travel.—Allowable for an employee on leave without pay when the travel is essential to fulfillment of his role in the training project.

The above limitations do not apply to individuals who are part-time Federal employees.

Fringe Benefits.—The employer's share is allowable to the extent that such payments are made under formally established and consistently applied institution policies, uniformly charged as a direct cost on an actual rather than an estimated basis, and charged in proportion to salary charged to the grant. The employee's share is part of the gross salary and included therein. Not allowable for trainees.

Honoraria.—Not allowable. (An honorarium is considered a payment or reward where the primary intent is to confer distinction on, or to symbolize respect, esteem, or admiration for, the recipient. A consultant fee, on the other hand, e.g., fee for a visiting lecturer, is compensation for services rendered and is allowable.)

Hospitalization Costs.—Allowable with prior Public Health Service approval in accordance with negotiated rates. Not allowable for foreign grants.

Insurance.—Allowable for premiums on hazard, malpractice, and other liability insurance to cover personnel directly connected with projects supported by Public

Health Service grants. Not allowable for premiums on equipment.

Land or Buildings.—Purchase costs not allowable.

Leave.—Allowable when earned on the project which the grant is supporting and prorated in accordance with the salary charged to the grant. Not allowable for trainees except as provided on page 18.

Library Support.—Not allowable. (See *Books and Periodicals,* page 23.)

Meals.—Allowable for patients under study, or when an institution customarily provides for meals to employees working beyond the normal workday, or as a part of the salary arrangement. Guest meals are not allowable.

Outpatient or Subject Costs.—Allowable with prior Public Health Service approval, including travel with escort, if required.

Overtime.—See *Salaries and Wages,* page 29.

Publication.—

Page Costs.—Allowable to assure effective publication of results of work supported by grant provided that charges imposed by scientific journals are equitably applied, regardless of the sources of support. Prior approval required for additional charges for immediate or accelerated publication.

Books.—Prior approval required for the cost of publishing books, monographs, pamphlets, brochures describing training activities, and dissertations and theses prepared by trainees.

Recruitment Costs for Trainees.—Costs of descriptive brochures or other costs directly related to the recruitment of trainees are allowable. Grant funds may not be used, however, to pay prospective trainees for transportation, per diem, or other related recruiting costs.

Relocation of Employees.—Allowable for costs to an individual recruited for full-

time employment on a Public Health Service supported project. Costs may include moving him, his family, dependents, and household goods if payment of such costs is normally made by the grantee, regardless of the source of funds. If the employee resigns for reasons within his control within 12 months after employment, the grantee must credit the grant account for the relocation costs. Relocation costs are not allowable for personnel employed to work part time on a training project.

Rental of Equipment.—See *Equipment Rental*, page 25.

Rental of Space.—Allowable when charges are made in conformance with institution policies and in the same manner that similar charges are made to any account. No rental charge may be made for space owned or controlled (managed or administered) by the grantee or a collaborating institution, except that a charge may be allowed equivalent to the cost of ownership; e.g., depreciation or use allowance, taxes, and normal maintenance and operating costs. Also, when a grantee transfers a facility to a third party through sale, lease, or otherwise, and then leases the facility back from that third party, the lease cost which may be charged to Public Health Service grants may not exceed the equivalent of the "cost of ownership."

Sabbatical Leave.—Salary, as such, not allowable, but sabbatical leave costs to the institution may be included in a composite fringe benefit rate.

Salaries and Wages.—Allowable for time or effort spent on a grant-supported project. Rate must be consistent with salaries paid from institution funds. No supplementation of base salary is permitted; however, when the individual's full-time base salary is for a period of less than 12 months, the salary may be charged to the

grant for periods not covered in the employment contract.

"Full time" may include such activities as (*a*) scholarly writing, (*b*) service on advisory groups, or (*c*) participation in a seminar or symposium or similar activity related to the training, provided these activities remain incidental and are undertaken within the policy of the grantee.

Where the individual is part time (including "geographic full time"), the base salary for determining charges to the grant will be the salary which he would have earned if he had been full time. Where a grantee provides a guaranteed salary plus an additional amount dependent on such things as the total income of a group clinic operated by the grantee, full-time salary may be considered as the guaranteed amount, or as the combination of the guaranteed amount and the additional amount not to exceed a formally established ceiling, or the amount that reflects the individual's most recent full year's experience, whichever is the smaller.

Where less than a full year of experience has been gained by the individual, an amount comparable to that received by some other individual with similar duties would be used. Time or effort on the grant could therefore be prorated against the total of the guaranteed and the additional salary.

When all of the salary of nonprofessional personnel is charged to projects supported only by grants and contracts, *overtime* may be charged to any Public Health Service grant for which the overtime was worked. When the salary is charged partly to institution funds and partly to either grant or contract funds, the total of the salary (both regular rate amount and premium rate amount) must be prorated in accordance with the time spent on the Public Health Service project. On the other hand, where

the grantee has a policy of charging premium overtime to the indirect cost pool, no premium overtime can be charged directly to the grant.

Salary and wage rates must be in conformity with those permitted by the institution's wage/salary scales and policies.

Grant funds budgeted for an individual's salary but released as the result of transfer of support of an individual to the Public Health Service research career program may not be used without prior Public Health Service approval.

Time or effort reports are not required for personnel whose full-time activity is devoted to one Public Health Service supported project.

For nonprofessional staff, charges for salaries and wages will be supported by time and attendance and payroll distribution records.

For members of the professional staff, current and reasonable estimates of the percentage distribution of their total effort may be used in the absence of actual time records. The term *professional staff* includes professors, instructors, research associates and assistants, graduate students, and other persons performing professional work. In order to qualify as current and reasonable, estimates must be made no later than 1 month (though not necessarily a calendar month) after the month in which the services were performed. On the other hand, in the case of *professorial staff* at educational institutions and of any others whose compensation is chargeable in part to instruction and in part to "organized" research, the estimates of effort expended must be made at appropriate time intervals, but in no case less frequently than once each quarter. Estimates determined before the performance of services, such as budget estimates on a monthly, quarterly, semester, or yearly

basis, do not qualify as estimates of effort spent.

The percentage reported need not be the same for each period reported. The total for the entire budget period, however, must equal or exceed the percentage of the salary charged to the grant. When the awarding unit has waived requirements for prorating professional salaries (see page 35) one report may cover the time or effort an individual has expendend on projects supported by separate grants.

Except for grants made to foreign institutions, time or effort reports are not to be sent to the awarding unit but must be retained by the grantee and made available for inspection by Federal auditors and Public Health Service staff. Time or effort reports must be included with the audit documents supplied to the awarding unit by foreign institutions.

Stipends (Trainees).—See page 14.

Subgranting.—Not allowable. The grantee may not, in whole or in part, delegate or transfer responsibility for the use of grant funds to any other institution, organization, or person. This ruling does not preclude contracts related to the conduct of the project.

Supplies.—Allowable.

Taxes.—Only those taxes which an institution is required to pay as they relate to employment, services, travel, renting, or purchasing for a training project are allowable. Property taxes on land, buildings, equipment, or supplies are not allowable.

Travel.—Domestic travel is that travel (including local travel) which is performed within the grantee's own country, except that travel between the United States (including Guam, American Samoa, Puerto Rico, the Virgin Islands, the Canal Zone, and the Trust Territory of the Pacific Islands) and Canada, is also considered domestic travel for grants made to institu-

tions within the United States or Canada. Other travel performed to, between, or within a country other than the grantee's own country is defined as foreign travel.

The policies of the grantee will govern travel by staff paid from grant funds, except that less than first class air travel must be used when available. U.S. Standard Government Travel Regulations must be followed if the grantee has no established policy.

Grants exclusively for travel to meetings or conferences are not awarded as training grants.

Travel (Employees).—Allowable, where such travel will provide direct benefit to the project being supported, including attendance at meetings. Prior approval required (*a*) for domestic travel if the total required for the travel category exceeds the amount approved by the awarding unit, or (*b*) for any foreign trip.

Travel (Trainees).—See page 16.

Tuition and Related Costs (Employees).—Allowable with prior Public Health Service approval when specialized training is required for the project. Other tuition costs not allowable unless treated consistently as a fringe benefit. Tuition remission for members of the families of employees allowable only when included in a composite fringe benefit rate.

Tuition (Trainees).—See page 17.

Indirect Cost

Policy.—Unless otherwise stipulated by the awarding unit an indirect cost allowance may be provided. The indirect cost allowance for each grant will be computed at the rate of 8 percent of allowable direct costs.

Definition.—Indirect costs are those which because of their nature are normally identified with common or joint objectives and are not readily identified with specific or individual projects. The general types of

indirect costs include general administration expenses, administration expenses which apply to training activities administered in whole or in part by a separate organization or an identifiable administrative unit, operation and maintenance expenses, and library expenses.

Not Allowable.—Indirect costs will not be allowed on the following direct cost expenditures:

1. Alterations and renovations of any type.
2. Cost of any item of equipment in excess of the first $2,500.
3. Hospitalization or hospital bed costs.
4. Tuition or related fees.
5. Grants to institutions or organizations outside the territorial limits of the United States.

To Be Negotiated.—Indirect costs on the following direct cost expenditures are subject to individual agreements between the grantee and the awarding unit:

1. Rental of space.
2. Contracts for services related to the conduct of the training project.
3. Grants to institutions where the training project is to be conducted fully or partially in Federal installations.
4. Conference grants.
5. Limited services furnished by the grantee to support a project in which the major part of the work is to be performed off-campus.

REBUDGETING OF FUNDS

The Public Health Service permits the grantee to depart from the approved budget and use grant funds for other permissible items required for the project, except that prior approval of the Public Health Service (see definition, page 3) is required for the following purposes:

1. Increase or decrease in amount for trainee stipends.
2. Use for any purposes disapproved as a condition of the award.
3. Alteration and renovation costs in excess of $250.
4. Changes in approved budgets for grants in support of conferences.
5. Equipping or furnishing of offices, conference rooms, reception rooms, or similar space.
6. Items of equipment or accessories costing in excess of $1,000.
7. Patient care costs (hospitalization or outpatients).
8. Printing equipment.
9. Publication of books, monographs, pamphlets, dissertations, or theses.
10. Travel in excess of the total amount approved for the travel category or for any foreign trip.
11. Consultant fees to individuals otherwise employed by the grantee.
12. Purchase by foreign grantees of non-U.S. manufactured equipment costing $2,000 or more.
13. Tuition and related costs for employees.

REFUNDS

During the project period, refunds and rebates should be credited to the account. Credits received after the termination of the project period shall be refunded to the awarding unit. Checks should be made payable to Public Health Service, Department of Health, Education, and Welfare, Bethesda, Md. 20014.

Interest or Other Income

Interest or other income earned on grant funds must be forwarded to the awarding unit.

Royalties and Profits

When the costs of publications, films, or similar materials are provided from Public Health Service grants, any royalties or profits up to the amount charged to the grant for publishing or producing the material shall be refunded to the Public Health Service.

Refund at Termination of Project Period

At the end of the project period the final report of expenditures will show any unexpended balance. Refund to the Public Health Service will be made in accordance with instructions.

ACCOUNTING, RECORDS, AND AUDIT

Accounting

Accounting of grant funds will be in accordance with institution accounting practices, based on generally accepted accounting principles, consistently applied regardless of the source of funds. Itemization of all supporting records of grant expenditures must be recorded in sufficient detail to show the exact nature of expenditures. Where personnel costs apply to two or more research and/or training projects, proration of costs to each grant involved will be made except that professional salaries need not be prorated in those instances where the awarding unit agrees that two or more separate grants are concurrently supporting projects that constitute one identified activity or program. In such instances, the total allowable salary may be charged to any one of the grants involved.

Financial Records

The financial records, including all documents to support entries on the accounting records and to substantiate charges to each

grant, must be kept readily available for examination by personnel authorized to examine Public Health Service grant accounts in an institution. All such records must be maintained for 5 years after the end of each budget period; and if questions still remain, such as those raised as a result of audit, related records should be retained until the matter is completely resolved.

Audit

Public Health Service grants are subject to inspection and audit by representatives of the Department of Health, Education, and Welfare to (*a*) verify financial transactions and determine whether funds were used in accordance with applicable laws, regulations, and procedures; (*b*) ascertain whether policies, plans, and procedures are being followed; (*c*) provide management with objective and systematic appraisals of financial and administrative controls, including information as to whether operations are carried out effectively, efficiently, and economically; and (*d*) determine reliability of financial records and reports. The audit activity is not intended to review scientific or technical aspects of the conduct of the project. The audit is performed in accordance with generally accepted auditing practices in determining that there is a proper accounting and use of grant funds. Failure of a grantee to appeal a proposed audit disallowance within 30 days after receipt of written notification will make the action of the Public Health Service conclusive.

Grantees located outside the United States shall supply the awarding unit with certified true copies of the necessary fiscal documents, including time or effort reports, to support the expenditures charged to the grant. The documents supplied will be returned to the grantees upon completion of the audit.

Obligations or Expenditures

Obligations, encumbrances, or expenditures normally will be made within the budget period indicated on the notice of grant awarded. Except for certain programs which, under existing legislation, specifically provide otherwise, grant funds may not be used to reimburse obligations or expenditures made prior to the beginning date of an initial grant for a new or renewal project. Prior to the beginning date of a continuation award, the grantee may at its own risk incur expenditures which exceed Public Health Services authorization but which are considered essential to the conduct of the project. The awarding unit will allow reimbursement of such expenditures from the continuation grant when awarded, provided that the items concerned are incorporated in the approved budget of the continuation grant and that, where required for restricted categories, prior approval was obtained.

Equipment—Title and Accountability

Title to equipment purchased with grant funds resides with the grantee, but the equipment must be accounted for during and after the end of the project period. Accountability may be satisfied by continued use during its useful life in the same or other projects related to objectives of the Public Health Service. If the equipment is disposed of or transferred during its useful life to a use outside the scope of the Public Health Service objectives, an amount equal to the value at the time of disposal must be deposited in the grant account if still open, or refunded to the Public Health Service. The Public Health Service, however, reserves the right in unusual situations to transfer the equipment and the title thereto either to some other grantee or to the Public Health Service.

REPORTS

Statement of Appointment of Trainee

A statement of appointment or reappointment is required for each trainee at the time the training period of the individual begins. No training stipend may be paid until a statement of trainee appointment has been submitted to the awarding unit. (See page 13.)

Report of Expenditures

A report of expenditures for each budget period is required within 120 days after the end of the budget period. The report forms are routinely mailed to the grantee before the end of the budget period and should be completed in accordance with the instructions on the form. Continuation grants will not be awarded if required expenditures reports have not been received.

Interim Progress Report

Interim progress reports must be submitted to the awarding unit with all applications for continued support in accordance with the instructions accompanying the application forms or received from the awarding unit. All interim reports will be treated as restricted information.

Terminal Progress Report

A final progress report is required within 90 days after the terminal date of the project. The report should identify the grant number, period covered, program director, institution, and title or area of training. Instructions will be furnished by the awarding unit concerning the detailed information needed and the number of copies.

Invention Report

Immediate and full reporting of all inventions to the Assistant Secretary (Health and Scientific Affairs), Department of Health, Education, and Welfare is required.

Annual Invention Statement

In addition to the immediate reporting of inventions, an annual invention statement is required with each continuation and renewal application.

A final invention report is required within 30 days after completion of a project period. Also, when a program director ceases to direct a project, a special invention report should be filed to cover the activity of that program director.

MISCELLANEOUS

Safety Precautions

The Public Health Services assumes no responsibility with respect to accidents, illnesses, or claims arising out of any work undertaken with the assistance of a Public Health Service grant. The grantee is expected to take necessary steps to insure or protect itself and its personnel.

Federal Income Tax

Determination of the tax status of an individual receiving compensation in any form from a Public Health Service grant is the responsibility of the Internal Revenue Service.

Military Service

The Public Health Service will not intercede in behalf of an individual in relation to military status. A trainee stipend may be continued for a period not to exceed 15 days of military active duty training in any one Public Health Service appointment period.

Visa Status of Non-United States Citizens

The Public Health Service will not intercede in behalf of non-United States citizens who may be program directors or who may otherwise be participating in a project, and whose stay in the United States may be limited by their visa status. For this reason the grantee should determine, and the ap-

plication should indicate, that the individual's visa will allow him to remain in the country a sufficient length of time to be productive on the project.

Visa Status of Non-United States Citizen Trainees

For citizenship requirements for trainees, see page 12.

*RESEARCH COORDINATING UNITS; *STATE PROGRAMS; *VOCATIONAL EDUCATION; *EDUCATIONAL RESEARCH; *PROGRAM DESCRIPTIONS; INFORMATION DISSEMINATION
*RHODE ISLAND OCCUPATIONAL RESEARCH AND DEVELOPMENT COORDINATING UNIT

The Research Coordinating Unit (RCU) continued to emphasize the dissemination function, especially of research finding accumulated at the Educational Resources Information Center, by mailing monthly RCU bulletins to all interested individuals throughout the state and providing assistance and information at the Unit's facilities. In addition, the Unit continued to perform its duties of stimulating, encouraging, and aiding vocational research by meeting with interested persons and offering advice on research proposals. Although there is a problem of support for localized research, a transfer of federal funds was approved to finance a small research project to evaluate teacher training in vocational education throughout the State. A complete report should be available by August 1968. The Unit is submitting a research project for studying the interpretation of drawings during the guidance process in occupation selection and has also been given the responsibility for preparing the vocational section of an all-college proposal to be submitted under the Professional Practices Act. In addition to the usual local meetings the RCU has attended, a member of the Unit attended the (1) Vocational Guidance Information Systems conference in Manchester, New Hampshire, (2) The American Vocational Education Research Conference in Chicago, (3) the Regional Conference for RCU's in Albany, New York, (4) the American Institute for Research in Pittsburgh, and (5) the National Diffusion Conference on the Diffusion of Educational Ideas. PROGRESS REPORT

OE Bureau of Research No. BR 6-2776 Grant No. OEG 1-6-062776-2142

Period January 1, 1968 to March 31, 1968 Date of submission April 26, 1968

Name of institution: Rhode Island College

Title of project: Establishment of an Occupational Research and Development Coordinating Unit for the State of Rhode Island

Name of project director(s): Charles W. Hailes, Director
Philip S. Very, Associate Director

1. Major activities and accomplishments during this period--

In keeping with the need for increased dissemination of the wealth of research findings accumulated at the ERIC Center, the Rhode Island Research Coordinating Unit continued to emphasize dissemination functions. Monthly RCU bulletins were mailed to all interested individuals throughout the State. Further remarks on this aspect occur in category four of this report.

In addition to dissemination activities, this unit continued to perform its duties of stimulating encouraging and aiding vocational research in the state. As examples, early in January the staff met with Mr. McKenna and Mr. Davey of the State Department regarding the writing of a proposal dealing with Social and Economic Disadvantaged students, with Mr. Wiggin of the Speech Department at Rhode Island College regarding research on students' attitudes, with Dr. George Estabrooks of the Psychology Department to discuss the possibility of establishing a hypno-analysis institute for counseling students, with the Dean and Vice President regarding the writing of an all-college policy on research on human subjects, with Dr. Lee DeLucia of the Psychology Department at Rhode Island College regarding indentification of aptitudes of children throughout the state and with Mr. O'Shea, Mr. Laurel and Mr. Frisk of Mount Pleasant High School regarding research using 4 c's funds. In the middle of January the unit staff visited Miss Cullen of the Cumberland High School Department, Dr. King of Industrial Arts at Rhode Island College, Dr. Harshman of Special Education and Mr. John Salvatore, all with respect to possible research projects in vocational education. On January 15, a conference between the staff of the unit, the college dean and members of the State Department of Education discussed research projects and possible funding. The following day members of the unit spoke with Mr. Francis Charland, of Rhode Island School for the Deaf, who is interested in writing a research proposal.

The above gives some idea of the type of contact being made by the unit and is presented here as an example. The period described was only sixteen days, a typical period experienced by the unit. During the remaining two and one-half months of this quarterly period, many of the above were revisited and many new people received advice and information from the unit.

2. Problems--

We do have a problem of support for localized research; however, it is hoped that this can be overcome in the near future.

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION
THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

3. Significant findings and events--

Due primarily to the fact that no monies were forthcoming from the state department of education to finance several worthwhile research projects of state interest, this unit was forced to either seek funds for interested researchers from other sources or utilize the funds from the college and Federal Government. In spite of the fact that the state department of education has not found it feasible to finance a small research project to evaluate teacher training in vocational education throughout the state, it was felt the project was of sufficient importance that a request was submitted and approved by the U.S. Office of Education to transfer funds to make this research possible. In February a research associate, Mr. Richard Prull, took a year's leave of absence from his doctoral studies in psychology and came to Rhode Island to work full-time in the unit on the Teacher Training Evaluation Project. After surveying ERIC documents and contacting various sources, a questionnaire was constructed and is presently being administered to supervisory teachers and young teacher education graduates of all vocational education programs in the state and to business and industrial leaders. By August a complete report of the present status of teacher education in vocational education together with suggestion for improvement of present programs and development of new programs will be made available to interested individuals. The research is going very well; all contacted individuals have been most cooperative.

The unit is also submitting a research project to be conducted by Mr. Marusic of the counseling department at the University of Rhode Island. Mr. Marusic will be studying interpetation of young people's drawings in the guidance process toward selecting an occupational area.

The unit has also been given the responsibility for preparing the vocational section of an all-college proposal to be submitted under the Professional Practices Act. Several innovations in vocational education programs are being prepared.

4. Dissemination Activities--

As the unit begins its second year of operation, the fruits of its labor are already appearing. Telephone calls from individuals throughout the state seeking information and guidance continue to increase. Personal visits to the unit's facilities also are rapidly growing, to the point that there are often more than one individual seeking advice from the staff at a given moment, and occasionally as many as six visiting people in the office at once, speaking with the staff members, or surveying the ERIC documents or the AIM and ARM pamphlets.

Although the unit's main intent was not to purposely broaden its dissemination field beyond the major area of vocational education, the unit has begun to be known as a center for all individuals seeking information in educational research. The staff is constantly being consulted by researchers and, administrators in education desirous of obtaining information regarding research studies underway and completed, availability of various federal, state and local funds and similar questions. Requests for microfiche are steadily accelerating.

Favorable comments on this units monthly bulletin of dissemination continue to be received. Individuals are requesting more information on articles printed in the bulletin and this unit is glad to either supply the information or refer them to the source of the original complete article.

Finally, in addition to the bulletin and individual contact with teachers, researchers, administrators, and members of business and industry, this unit continues to demonstrate its desire to disseminate information about the unit and vocational education research by speaking to various civic groups public school groups and college and university classes regarding ERIC, writing research in vocational education and related subjects. Throughout the state, the staff of this unit finds people eager to learn of ERIC and vocational education research, most of them being deficient in their knowledge of this area.

5. Capital equipment acquisitions--NONE

6. Forms--NONE

7. Other Activities--

In addition to the usual local meetings the RCU has attended, a member of the unit was present at the Vocational Guidance Informations Systems Conference in Manchester, New Hampshire, at the American Vocational Education Research Conference in Chicago (where one of the staff members presented a research paper) at the Regional Conference for Research Coordinating Units in Albany, New York, at the American Institute for Research in Pittsburgh, at the Conference in Montpelier, Vermont regarding a New England and New York RCU regional research proposal and at the National Diffusion Conference on the Diffusion of Educational Ideas. Finally, trips were made to the regional RCU Center in Boston.

8. Staff summary--

Name	Title	Funds Federal	Funds Local	Period	Percent of time
Charles Hailes,	Dir.	$3500.00	None	12/27/66	100%
Philip S. Very,	Assoc.Dir.	295.00	$1,122.00	9/1/67	50%
Richard Prull,	Research Associate	1289.00	None	2/1/68	100%
Geraldine Boscalia,	Secretary	1098.00	None	1/30/67	100%

9. Future activities planned for next reporting period--

The major thrust of this office will continue to be dissemination activity, which is steadily increasing in volume. The unit will continue to collect data on its teacher training evaluation and will continue to encourage and stimulate vocational education research projects. This past year has seen a greater awareness of the college and state wide community of the purpose and functions of this office. It is expected that in the months to come even more individuals will call or come to this office to obtain general information, microfiche, grant proposal information and the like.

EMERGENCY PROGRAMS; *PUBLIC HEALTH; *STATE PROGRAMS; POLICY; COMMUNICATION; *MODELS; *PROGRAM ADMINISTRATION; STATE AGENCIES; AGENCY ROLE; CIVIL DEFENSE; HEALTH NEEDS; FEDERAL PROGRAMS; STAFF ROLE
*HEALTH MOBILIZATION PROGRAM

Designed to assist state health officers in preparing for effective emergency health service operation during periods of national or major natural disaster, the document consists of three major sections followed by a series of sample emergency operating documents. "Preparedness Actions" covers normal situations and conditions which require a substantial increase in readiness. Organization and Administration presents general information and covers activation and relocation. Functions describes the roles of the state health officer, the administrative officer, the health manpower division, the material and facilities division, the medical division, and the public health division. Examples of memorandums are (1) delegation of authority by the governor to the state health officer, (2) policies governing emergency health service and resource management operations from state officer to heads of local government, civil defense directors, and local health officers, and (3) licensure requirements and liability from governor to state officer. Other sample documents cover the emergency alerting system, the emergency operating center, essential records, inventory of essential operating records, anticipated post-attack health situation, emergency mobile field teams, and damage assessment and resource evaluation. PURPOSE AND USE OF MODEL PLAN

This model State plan is designed to assist State health officers in preparing for effective emergency health service operation during periods of national or major natural disaster.

If each State health department develops and maintains an emergency operating plan and readiness, it will be prepared to initiate emergency policies, standards, and procedures rapidly, and to assist local governments in meeting and overcoming unprecedented disaster medical care and public health problems.

This plan illustrates some of the types of emergency operating documents and procedures which should be developed to meet disaster needs of each State. Though some preparedness actions are described, the plan is primarily concerned with post-attack operations of the State health department. The Table of Contents indicates the scope and coverage of the plan. The sample documents and orders suggest how a State health agency might accomplish its emergency functions.

Food and drug safety activities are included, even though in some States they are the responsibility of other State agencies. Emergency public water supply activities are included by reference only; water supply is not within the scope of this model plan.

Though a written plan may reflect readiness, it does not in itself assure emergency operating capability. It is tested at the community level during a disaster. It is here that direct health services will be provided and the effectiveness of preparations will be proved. The State health department should set the preparedness example for local governments.

PHS Health Mobilization Program representatives assigned to State health departments and DHEW regional offices are available for consultation, advice, and assistance in translating this model plan into an effective emergency operations plan tailored to the unique needs and existing capabilities of each State.

STATE EMERGENCY HEALTH SERVICE PLAN

INTRODUCTION

This State Emergency Health Service Plan prescribes the policies, procedures, organization, functions, staffing, and other factors governing emergency operations of the State Health Department.

The Plan is intended for application during a national civil defense emergency. Portions of the Plan, however, may be utilized during a major natural disaster.

The Health Mobilization Program Director is responsible for maintaining the Plan and for preparing and distributing revised rosters, listings, and other materials as required and appropriate.

This Plan and subsequent revisions and additions are issued to, and shall be maintained by, all health officers within the State, all personnel assigned to the State Emergency Health Service, and other officials and organizations concerned.

This Plan supersedes the Health annex to the State Operational Survival Plan (1957).

/s/ STATE HEALTH OFFICER

EXAMPLE

I. PREPAREDNESS ACTIONS

	See Supplement Number
The primary objective of preparedness actions is to increase and maintain agency readiness to activate and operate the State Emergency Health Service (EHS). Actions which shall be accomplished during peacetime and during an Increase-Readiness Condition.* are specified below.	
A. NORMAL SITUATION	
The State Health Department shall routinely maintain:	
1. Current information on, and review and implementation of, Federal and State policies, laws and regulations pertaining to Emergency Health Services	
2. Alternate site for EHS operations (Emergency Operating Center - EOC)	5
3. Basic data on the location and inventories of health and water resources	13
4. Estimates of anticipated postattack emergency requirements and available health and water resources	8
5. Specific preparedness and emergency mission assignments for existing organizational units	
6. Current roster of EHS assignees	2
7. EHS alerting system	4
8. Periodic training and orientation in disaster practices and emergency duties of EHS assignees	
9. Mutual aid pacts with health departments of adjoining States	12
10. Formal agreements and working relationships with assisting agencies and professional societies	12
11. Radio communication capability, linking EHS EOC and State EOC	5
12. Essential operating record and reference materials pre-positioned at EHS EOC	6,7
13. Periodic EHS tests, exercises, evaluation, and revision of EHS Plan	
14. Guidance and consultation to assist local health officers and governments in developing and maintaining emergency health services capability	
B. INCREASE-READINESS CONDITION	
Arrangements have been made with the State Civil Defense Director to assure that the State Health Officer will be notified of an Increase-Readiness Condition, which will require a substantial increase in readiness to activate and operate the EHS and maximum	

*See Federal Civil Defense Guide, Part G, Chapter 5, for description of Increase-Readiness Condition.

EXAMPLE

	See Supplement Number
readiness to take action upon attack warning. The State Health Officer shall immediately:	
1. Initiate the EHS alerting system	4
2. Restrict EHS assignees' annual leave and travel	
3. Transfer accumulated essential operating records to the EHS EOC	6
4. Require EHS assignees to review EHS Plan	2
5. Inspect EHS EOC and pre-positioned supplies and equipment	5
6. Correct PDH deficiencies	13-A
7. Conduct EHS test exercise	
8. Relocate EHS assignees to (1) State EOC, or (2) EHS EOC, as directed	2,3

EXAMPLE

II. ORGANIZATION AND ADMINISTRATION

See Supplement Number

A. GENERAL

The peacetime structure of the State Health Department is not appropriate to anticipated emergency program needs and responsibilities. Extraordinary actions must be taken to cope with unprecedented postattack health problems. Health resources management responsibilities will be greatly increased. Regular programs not concerned with disaster needs will be modified or suspended. The State Health Department will be reorganized and expanded, becoming the State Emergency Health Service (EHS). Its primary mission will be to assist communities to meet the postattack civilian health needs. 8 1

B. ACTIVATION

The EHS shall be activated by the State Health Officer upon:

1. Attack on the United States,
2. Presidential or Congressional declaration of a national civil defense emergency, or
3. Direction by the Governor.

EXAMPLE

C. RELOCATION

1. State Emergency Operating Center (EOC)

   Assuming that the State Office Building is in a high-risk location, the State has established a protected alternate site for emergency operations at the_____ _____. According to the State Operational Survival Plan, the State Health Officer and_____employees of the State Health Department shall relocate to the State EOC upon an Increase-Readiness Condition. They shall advise the Governor and act as liaison with other State officials during the fallout pindown period. 2

2. EHS Emergency Operating Center

   The State Health Department has established an alternate site for EHS operations at the_____(a low-risk location____ miles from the capital). It supplements limited EHS capability at the State EOC and provides facilities for full-scale EHS operations. _____EHS assignees shall relocate to this site during an Increase-Readiness Condition (the total number is based on shelter capacity). If the State Health Department building is destroyed, damaged, or otherwise unusable, additional surviving health department employees, nongovernment EHS assignees, and reservists shall report to the EOC for duty when fallout radiation level permits. 5 2

D. EHS ORGANIZATION

In the immediate postshelter period the EHS shall be organized as shown in the diagram below.

EXAMPLE

III. FUNCTIONS

See Supplement Number

A. OFFICE OF THE CHIEF

The State Health Officer (Chief, EHS) directs and coordinates all EHS activities, advises the Governor on the health situation and needs, and represents the Governor in all dealings with the DHEW Regional Health Director (Chief, Federal Regional EHS). Specific duties: 1

1. Immediately postattack (as soon as intelligence data and communications permit)

   a. Performs damage assessment and resource evaluation 11

   b. Determines most effective utilization (including redistribution) of State-controlled health resources 23

   c. Issues public announcements pertaining to major health hazards, protection, and treatment

   d. Issues to local governments policy and guidance directives pertaining to major health hazards, defensive actions, and health resource controls 9

   e. Provides requested consultation and assistance to local health and medical authorities

2. Postshelter

   a. Re-establishes and maintains communications and working relationships with State agencies, local health authorities, EHS field offices, and Federal Regional EHS

   b. Re-establishes liaison with health agencies of adjoining states

   c. Implements and assures conformance to Federal EHS and State directives and policies

   d. Reports health situation, major problems, and needs to the Federal Regional EHS 14

   e. Recommends needed State legislation affecting public health 15

   f. Directs EHS reorganization based on changing program needs

   g. Re-establishes inoperative local health and medical agencies 10

B. ADMINISTRATIVE OFFICE

This office provides centralized administrative, personnel, fiscal, communications, and other office services. Specific duties:

1. Arranges billeting and subsistence for relocated personnel 2

2. Places job orders with local State Employment Service office 2

3. Secures transportation for employees involved in field travel 10

EXAMPLE

	See Supplement Number
C. HEALTH MANPOWER DIVISION	
This division directs all EHS activities pertaining to health manpower mobilization and management and necessary to carry out health and medical programs. Specifically, this division:	16
1. Assesses requirements and determines location and numbers of surviving health manpower	13
2. Issues news releases requiring all health manpower to report to one of the following:	
(a) emergency assignment	17
(b) nearest health facility	
(c) local emergency manpower organization for health service assignment	
3. Issues standards and ratios for assignment of health manpower to achieve the most effective balance between resources and requirements	
4. Requisitions and transfers health manpower according to need	18
5. Requests assistance from State emergency manpower organization in locating and referring health and supporting manpower	
6. Reports additional health manpower requirements to DHEW Regional EHS	15
D. MATERIEL AND FACILITIES DIVISION	
This division provides health materiel management policies and guidance consistent with State and Federal objectives; directs all EHS activities pertaining to requirements, procurement, distribution and use of health supplies and facilities; and claims and allocates essential supporting services, supplies and controlled materials.	
The following functions are arranged in approximate order of priority.	
1. Requirements and Distribution Branch	
a. Assesses damage to and losses of health facilities (e.g., hospitals, clinics, blood banks, laboratories)	11 13
b. Assesses damage to and losses of health end-item inventories at producers, wholesalers, retailers, hospitals, etc.	11 13
c. In cooperation with State Production Agency, assesses health supplies and equipment production and distribution capabilities	11 13
d. Issues priorities and instructions for the controlled distribution of health supplies (including narcotics) and equipment to individual consumers	19 23
e. Issues instructions for controlled distribution of health supplies and equipment required by health facilities	20,21 24,25

EXAMPLE

	See Supplement Number
f. Issues procurement procedures--according to Department of Commerce (BDSA) and other resource agency emergency instructions--for maintenance, repair, and operating supplies and equipment.	26 25
g. Prepares time-phased estimates of requirements for essential health survival items, health materiel resources, and supporting goods and services	
h. Determines surpluses and deficiencies by geographic area	22
i. Regulates distribution of State-controlled health resources	
j. Issues instructions freeing allocations of primary health end-items in accordance with Federal policy and procedures	
k. Prepares reports on end-item inventories and health facilities	
l. Requests recovery and salvage of medical supplies, equipment, and facilities	
2. Claimancy Branch	
a. Determines quantities and types of health end-items available for public consumption through the wholesale and retail system	
b. Claims resources and assists communities to obtain health and supporting resources	
c. Issues application instructions for controlled materials	27
d. Issues instructions supplementing agency directives on supporting resources	
e. Prepares and coordinates instructions to production and resource agencies for allocation of health resources	
3. Supply and Transportation Office	
a. Submits estimates of transportation requirements to State Transportation Control Agency	
b. Arranges for the intercommunity movement of patients, supplies, Packaged Disaster Hospitals, retail health stocks, and supporting materials	
4. Producer and Wholesaler Liaison Office	
a. Establishes working relationships with wholesalers and retailers and with State agencies controlling essential survival resources and services	
b. Assists in expediting deliveries of materials to health supply producers	
c. Assists in expediting drug wholesaler orders for health-end items	
d. Coordinates specifications and provides guidance for item substitution	

EXAMPLE

See Supplement Number

E. MEDICAL DIVISION

This division directs all EHS activities pertaining to civilian medical care and treatment. Specific duties:

1. Issues diagnostic and treatment guides for unusual illnesses and injuries (e.g., burns, radiation illness, exotic communicable diseases)

2. Issues guidance on expedient, improvised, and substitute treatment techniques and therapeutic agents

3. Provides guidance and standards relevent to external radiation exposures significant in medical care and treatment

4. Provides professional consultation and advice on mental health, maternal and child health, nutrition, radiology, etc.

5. Provides guidance and standards for hospital expansion, casualty management, emergency ambulance services and outpatient care

6. Issues directives establishing or revising hospital admission and discharge policies

7. Directs and coordinates interarea (intrastate) transfers of patients

8. Prepares and maintains vital statistics, casualty and health situation reports

9. Establishes and expands physical rehabilitation centers and services

10. Provides guidance and assistance in the establishment or expansion of blood banks and bleeding stations, and the procurement and use of whole blood, plasma, and volume expander

F. PUBLIC HEALTH DIVISION

This division directs EHS activities pertaining to public health services. Specific duties:

1. Assembles and dispatches teams to investigate and assist in overcoming severe local health problems and to establish or re-establish local public health agencies

10

2. Maintains epidemic intelligence, health hazard reporting and analysis

3. Prepares and revises public health situation statistics and summary reports

4. Re-establishes and expands laboratory service facilities

5. Investigates and determines nature and causes of outbreaks of unusual or exotic diseases

6. Expands epidemic prevention, control, and immunization activities

EXAMPLE

	See Supplement Number
7. Issues guidance and provides consultation and assistance on reconstruction of sewerage facilities and prevention of overloading waste disposal facilities	
8. Re-establishes and expands milk and food sanitation and food and drug safety programs	
9. Evaluates and controls internal radiation exposure hazards associated with contaminated water, milk, and foods	
10. Provides professional consultation and advice on such matters as disposal of the dead, decontamination, drug salvage, expedient and improvised facilities and techniques, and the usual environmental and public health services	

EXAMPLE

DELEGATION OF AUTHORITY

TO : State Health Officer

FROM : Governor

SUBJECT: DELEGATION OF AUTHORITY

Authority for Delegation. [Cite Emergency Powers of the Governor]

Authorized to:

1. Direct and coordinate all civilian emergency health activities in the State

2. Suspend all health programs and activities which do not directly and immediately contribute to the saving of lives, prevention of illness, and prevention and control of serious health hazards

3. Reorganize the State Health Department as necessary

4. Assume direct operational control over emergency health functions anywhere within the state in the event of disaster beyond local control

5. Perform the following functions in the mobilization and management of the State's health manpower, facilities, supplies and equipment:

   a. Activate control procedures imposed by [Cite Order Directing Compliance with Consumer Rationing of Health Supplies]

   b. Requisition health facilities, claim and allocate supplies and equipment, and assign health manpower

   c. Enter into contracts and incur obligations necessary to protect the public health and provide emergency health services

Redelegation. This authority is conferred with authority to redelegate.

/s/ GOVERNOR

EMERGENCY HEALTH SERVICE ASSIGNMENT

TO : _____

FROM : State Health Officer

SUBJECT: EMERGENCY HEALTH SERVICE ASSIGNMENT

You are hereby directed and authorized to report for emergency duty at:

☐ EHS Emergency Operating Center
_____

☐ State Emergency Operating Center
_____

☐ Immediately upon receipt of "Relocate" notification

☐ Immediately postshelter, as soon as radiation levels permit

You are assigned to the position of _____, _____, State Emergency Health Service.

The attached State Emergency Health Service Plan provides information about preparedness and emergency actions. Become especially familiar with the functions of the unit to which you are assigned and with the pertinent reference documents. Review the Inventory of Essential Operating Records and send to the Administrative Officer any additional record or reference items which you would require during an emergency.

EXAMPLE

The attached identification card may help to expedite travel; carry it in your wallet.

Know the alerting system and carry the attached alerting diagram in your wallet. Notify the Mobilization Officer if there is any change in your telephone numbers.

I suggest that you prepare and practice a family survival plan. The attached kit of pamphlets will be of assistance to you.

If you wish further information, contact the Mobilization Officer.

/s/ STATE HEALTH OFFICER

Attachments:
State EHS Plan
Civil Defense Identification Card
Family Survival Guides Kit

EHS ALERTING SYSTEM

ALERTING PROCEDURE

1. Upon receipt of an "Increase-Readiness" notice, the State Health Officer immediately initiates the alerting call-down system, relaying the message verbatim to the personnel listed immediately to the right of his name on the alerting diagram.

2. In turn, each employee receiving the message relays it to persons named.

3. The first number is the office extension; the second is the home telephone.

4. If an employee can not be contacted, the caller must make the additional calls. THE CHAIN MUST NOT BE BROKEN.

PREPAREDNESS ACTIONS

Upon receipt of an "Increase-Readiness" message, each designated relocatee shall immediately:

1. Stand by for subsequent alert calls

2. Curtail travel and leave

3. Leave telephone number where he can be reached when he must be away from office or home

4. Test and rehearse his family survival plan

5. Prepare for relocation

EXAMPLE

MAINTENANCE OF ALERTING DIAGRAM

1. Carry the attached card in your wallet

2. If there is any change in your phone numbers, immediately inform the Health Mobilization Director and the person who would call you

3. Discard old diagram upon receipt of revised diagram

EHS EMERGENCY OPERATING CENTER (EOC)

GENERAL

The EHS EOC is established at _____, (a low-risk location____miles from the capital) to assure an emergency operating capability. The EOC shall be activated by the State Health Officer if the State health department office building is destroyed, damaged, or made unusable by an attack or local disaster. It supplements the limited EHS representation at the State EOC and provides facilities for full-scale EHS operations.

PROTECTION

The reinforced concrete EOC structure is estimated to be resistant to a blast overpressure of at least 3 psi. The basement fallout shelter area has a rated capacity of _____ persons. It provides a protection factor of at least 100. Several interior rooms on the first floor provide a protection factor of at least 40.

EXAMPLE

FACILITIES

Food, water, and medical and sanitation supplies and equipment, sufficient to maintain an austere level of subsistence for____persons for 14 days shelter occupancy, are stored in the shelter area and the protected rooms on the first floor. An emergency generator and fuel are sufficient to meet minimum electric power requirements in case of local service failure. A two-way short-wave radio assures communication with the State EOC and, through it, with local governments.

MAP

The following map shows the EHS EOC location and alternate travel routes.

FLOOR PLAN

The following floor plan shows space assignments for work, quarters, and shelter supplies.

EHS ESSENTIAL OPERATING RECORDS

RESPONSIBILITY

Essential record and reference materials for emergency operations are pre-positioned and maintained by the State Health Department Administrative Officer at the State and EHS Emergency Operating Centers. Each division chief is responsible for reviewing the records inventory periodically and selecting new or revised materials for transfer to the EOC's.

CLASSIFICATION

A specific organizational filing system has been established. Each record item is coded (upper right corner) with a subject classification and serial number derived from the EHS Staffing Table (Supplement 2). Example:

EXAMPLE

EHS Subunit or staff official

F-9.4 Civil Defense Information for Food and Drug Officials (FDA)

EXAMPLE

ANTICIPATED POSTATTACK HEALTH SITUATION

PLANNING BASIS

The State Plan is sufficiently flexible to apply to contingencies ranging from a single local disaster to widespread devastation caused by thermonuclear attacks. While the State EHS must be prepared to cope with any contingency, a single base is helpful for resources management planning. The following narrative illustrates a possible Statewide situation which could exist under the casualty and damage levels selected.

MEDICAL WORKLOAD

If casualty level of _____ % is applied, _____ of the State's population of _____ could become casualties. Of this number approximately _____ % (_____) would be expected to die before or after only minimal treatment, leaving an equal number who would require definitive treatment. Two-thirds (_____) of this latter group would require hospitalization some time during the first 30 postattack days, and one-third (_____) would require self, neighbor, or outpatient care.

RESOURCES

_____ percent (_____) of the peacetime total of _____ permanent hospital beds would survive an attack resulting in a casualty level of the magnitude described above. In addition, _____ % (_____) of the _____ Packaged Disaster Hospital beds pre-positioned in the State would be available for early use.

Approximately, _____ % of preattack stocks of health supplies located at wholesale drug warehouses, chain drug store warehouses, surgical supply houses, general and special short-term hospitals and drug stores would remain after such an attack. Of illustrative health supplies, _____ billion units of the preattack total of _____ billion units of penicillin, _____ of the _____ gauze pads, and _____ of the _____ doses of narcotics would remain.

As an index of professional health manpower availability, _____ % (_____) of the _____ physicians (M.D. and D.O.) might survive.

REQUIREMENTS

Estimated gross requirements for the first 30 postattack days could be for as many as _____ physicians and _____ hospital beds. However, as estimated above, only _____ physicians and _____ (permanent and PDH) beds are expected to be available. Because physician availability is the major limiting factor in the effective utilization of health material and facilities, and because it is not likely that additional physicians will be available from out-of-State sources for an extended period of time, it is necessary to derive a set of more realistic requirements. If it is assumed that each physician in good health (_____) can take care of an average of 15 hospital beds per day in a postattack situation, then _____ (_____ X 15) hospital beds can be effectively used. This means that a total of _____ additional beds could be utilized during the early postattack period.

Estimated 30-day postattack requirements for illustrative health supplies would be as follows: penicillin, _____ billion units; gauze pads, _____ ; and narcotics, _____ doses. Comparison of these required quantities with surviving State-controlled stocks (excluding PHDs, State and locally owned stockpiles, producer inventories, and Federal depots and stockpiles) indicates that the State will have available a _____ day supply of penicillin (a deficiency of _____ billion units); less than a _____ day supply of gauze pads (a deficiency of _____ pads); and about a _____ week supply of narcotics (a deficiency of _____ doses).

EXAMPLE

POLICIES GOVERNING EMERGENCY HEALTH SERVICE OPERATIONS

TO : All Heads of Local Government, Civil Defense Directors, and Local Health Officers

FROM : State Health Officer

SUBJECT: POLICIES GOVERNING EMERGENCY HEALTH SERVICE AND RESOURCE MANAGEMENT OPERATIONS

In the management, coordination, and provision of emergency health services and resources, you are hereby ordered to comply with the following policy directives.

A. ADMINISTRATION

1. Officially designate and authorize a single official, preferably a public health physician, as responsible for over-all direction and coordination of emergency health services and resources.

2. Immediately suspend the private practice of medicine and all health programs and activities which do not directly and immediately contribute to the saving of lives, prevention of illness, and prevention and control of serious health hazards.

3. Promptly report uncontrollable or unidentifiable communicable disease outbreaks to the State Health Officer.

4. Request health services and resources support and assistance from commanders of local military posts, if any, and request assistance from the State Health Officer only if and when all local sources of supply are nearing depletion and after all reasonable substitutions and improvisations have been employed.

EXAMPLE

B. SERVICES

1. In coordinating patient and casualty distribution among hospitals and clinics, include Federal nonmilitary and State medical care installations, if any, and prohibit non-medical criteria for patient admission, (e.g., race, sex, religion, residence, ability to pay).

2. Cancel elective treatment and surgery and limit hospital admissions, during the casualty overload period, to those whose survival depends upon hospital care.

3. Discharge all inpatients whose survival does not depend upon hospital services.

4. Immediately increase hospital bed capacities and establish all Packaged Disaster Hospitals in anticipation of increased admissions.

C. MANPOWER

1. Call all civilian health manpower, including retired, unemployed, unaffiliated, and refugee health manpower, to emergency health service duty at essential health facilities.

2. Promptly release military ready reservists and Public Health Service Commissioned Corps reserve officers ordered to active duty.

D. RESOURCES

1. Utilize, salvage, conserve, and control health resources on the assumption that outside assistance may not be available for as many as 30 postattack days.

2. Preserve and protect Public Health Service Medical Stockpile Depots, and Veterans Administration Medical Supply Depots, if any, until Federally-directed distribution is completed.

3. Quarantine, inspect, and decontaminate and salvage, or condemn and destroy, all health and medical supplies exposed to, or suspected of, contamination.

4. Quarantine and inspect all food exposed to, or suspected of, contamination, and assure that contaminated food is destroyed, or decontaminated and salvaged under guidance of responsible food authorities.

5. Invoke antihoarding regulations limiting essential health facilities to 14-day operating inventories.

6. Distribute retail and wholesale stocks of health and medical supplies and equipment only to essential health facilities and to individual patients having refillable prescriptions for life-saving drugs required for chronic serious medical conditions.

EXAMPLE

BY ORDER OF THE GOVERNOR /s/ STATE HEALTH OFFICER

EHS MOBILE FIELD TEAMS

PURPOSE

EHS Mobile Field Teams are required to re-establish inoperative community health offices, and make on-the-spot investigations of serious health hazards and problems.

FUNCTIONS

_____ teams are available to travel to specific areas to perform one or more of the following functions:

1. Re-establish inoperative community health organizations at the request of local authority
2. Investigate unusual or exotic disease outbreaks
3. Determine extent and character of local health situation and requirements as a basis for justifying requests for State or Federal assistance
4. Survey disaster areas at the request of State CD director to advise on re-entry timing, radiation exposure, health hazards, and health resource requirements
5. Provide direct personal consultation and advice to local health officials dealing with severe health management problems
6. Provide direct health services (e.g., epidemic control, mass immunization, vector and rodent control)

EXAMPLE

COMPOSITION

Team membership shall be drawn from available personnel at the EHS EOC. Depending upon the nature of the particular mission, each team may be supplemented by professional and technical specialists selected to deal with specific problems. Each basic team shall be composed of: 1 public health physician (Team Leader), 1 sanitary engineer, 1 public health nurse, 1 radiological health specialist, 1 epidemiologist, and 1 clerk (or staff assistant).

SUPPLIES AND EQUIPMENT

The following special items are pre-positioned at the EHS EOC for placement in mobile laboratory, other vehicles, or helicopters.

Quantity	Item
_____	Tape recorder and spare batteries
_____	Typewriter
_____	Radiological monitoring instruments
_____	Large-scale topographic maps
_____	Camera and (radiation proof) films
_____	Flashlights and spare batteries
_____	Binoculars
_____	Subsistence supplies and medical kit

Additional supplies and equipment requirements will depend upon the particular mission of each team.

DAMAGE ASSESSMENT AND RESOURCE EVALUATION

A. DAMAGE ASSESSMENT

1. Attack Analysis *(determining extent and character of attack)

   (a) Receive strike data (time of attack, kind of weapon)

   (b) Plot strikes

   (c) Plot fallout (based on weather and strike analysis)

   (d) Plot fire damage information

   (e) Receive reports of damage to transportation, communication, utilities, medical stockpiles, water impoundments, health facilities, etc.

2. Casualty Estimation *(determining effect on population)

   (a) Estimate number killed

   (b) Estimate number injured

   (c) Determine time-phased recovery characteristics

   (d) Estimate number unaffected

3. Resource Assessment **(determining effect of material resources)

   (a) Estimate amount of each health resource destroyed

   (b) Estimate amount of surviving resources temporarily inaccessable (determine re-entry time based on fallout conditions)

   (c) Estimate amount and location of resources listed in areas unaffected by attack

   (d) Review reports of losses in transportation, power, water supply, and accessibility of surviving supporting resources of concern to EHS

4. Prepare, as required, summary reports on damage effects and status of surviving resources, fallout maps, graphs, and other devices to illustrate the changing postattack health and water supply situation. Conduct staff briefings as required.

EXAMPLE

---

*Functions may be performed by a centralized damage assessment team at the State EOC; arrangements must be made to forward findings to EHS.

**Further guidance available in Health Materiel and Facilities Planning Guide for Emergency Management, (PHS Publication No. 1071-A-4).

B. RESOURCE EVALUATION

As local health officers' reports are received, and the situation becomes more clearly known, the various EHS program specialists will analyze what the losses in health resources, facilities, and manpower mean to EHS programs, and will determine to what extent the surviving accessible resources will meet the needs of the surviving population.

Evaluation includes:

1. Determination of time-phased quantitative requirements for health resources

2. Determination of time-phased quantitative requirements for supporting services and resources (transportation, manpower, fuel, communications) in consultation with State agencies responsible for them

3. Analysis of availability and adequacy of surviving health and supporting resources (supply-requirements analysis and determination of geographic imbalances)

EXAMPLE

AGREEMENTS WITH OTHER ORGANIZATIONS

In order to utilize the resources and capabilities of health and related organizations most effectively, the State Health Agency has negotiated formal agreements specifying the disaster mission, working relationships, and other applicable policy and procedures with each of the following organizations. As additional agreements are made, they shall be included in this plan.

A. American National Red Cross

Public Law 4, approved January 5, 1905, (33 Stat. 599) and as amended, imposes upon the American National Red Cross a responsibility ". . . to continue to carry on a system of national and international relief in time of peace; and to apply the same in mitigating the suffering caused by pestilence, famine, fire, floods and other great national calamities; and to devise and carry on measures for preventing the same."

It is essential, therefore, that in time of natural disaster the State Emergency Health Service should coordinate its activities with those of the American Red Cross.

EXAMPLE

B. State Health Departments of adjoining States

C. State University, Medical College (usage of space for EOC)

D. State Medical Society

E. State Hospital Association

F. State Dental Society

G. State Osteopathic Society

H. State Optometric Society

I. State Nursing Society

J. State Pharmaceutical Association

K. State Funeral Directors Association

L. State Podiatric Association

M. State Veterinarian Association

N. State Labor Department

MEMORANDUM OF UNDERSTANDING BETWEEN THE STATE CHAPTER OF THE AMERICAN OPTOMETRIC ASSOCIATION AND THE STATE HEALTH DEPARTMENT PERTAINING TO THE EMERGENCY ROLE OF OPTOMETRISTS

In recognition of the knowledge and skills which optometrists can contribute, and to assure unified effort in providing emergency health services, this agreement, based on the Association's Optometric Mobilization Plan, is published for the information and guidance of all concerned.

MOBILIZATION PLANNING

An optometrist representative will participate in the development of Emergency Health Service plans, especially as they pertain to the procurement, pre-positioning, and controlled issuance of optical equipment and supplies, and preassignment of optometrists to emergency health activities.

EXAMPLE

EMERGENCY OPERATIONS

Optometrists will:

1. During the shelter period--assist other health personnel in the care and treatment of shelter occupants

2. During the immediate postshelter period--assist in the emergency medical care program

3. When released from the latter assignment, and until more normal operations can be resumed, establish and operate Visual Care Sections where persons referred for priority treatment can have their eyes examined and receive corrective glasses from an emergency optometric kit or similar supply source.

/s/ PRESIDENT, STATE CHAPTER
AMERICAN OPTOMETRIC ASSOCIATION

/s/ STATE HEALTH OFFICER

COOPERATIVE AGREEMENT BETWEEN THE STATE LABOR DEPARTMENT AND THE STATE HEALTH DEPARTMENT

(Adapted from the Illinois Agreement)

This cooperative Agreement is entered into by the State Labor Department (hereinafter referred to as the State Manpower Service) and the State Health Department (hereinafter referred to as the Emergency Health Service) in order to assure the orderly mobilization, training, distribution and use of civilian health manpower in periods of national emergency.

I. GENERAL PROVISIONS

During a period of national emergency, the recruitment and referral of civilian health manpower will be the joint responsibilities of the State Manpower Service and the Emergency Health Service.

II. ASSIGNMENT OF RESPONSIBILITIES

A. The Emergency Health Service will have primary responsibility for organization, training, and utilization of the civilian manpower as identified in the attachment to this Agreement titled "List of Health Manpower Occupations."* Health authorities at the District Office levels will develop and maintain inventories of these health skills.

B. State Manpower Service will be responsible for the recruitment, assignment, and allocation of health skills not included in the "List," plus supporting occupational classifications, such as clerical, food, engineering, custodial, and laundry service, which are also closely coordinated with the health mission. Personnel possessing skills in these categories will remain in the general manpower pool unless assigned to health service by the State Manpower Service.

EXAMPLE

III. EMERGENCY REFERRAL PROCEDURES

Emergency procedures for referring persons whose classifications are contained in the attachment** to this Agreement are as follows:

A. Requests for health manpower will be made through local, State, and Federal health channels.

B. Hospitals, laboratories, and other organizations using health manpower at the local level will notify the responsible local health official of their requirements. If he is unable to meet the requirements by reassignment of available health manpower, he will place (or authorize the operating organizations to place) orders with the local manpower office and report remaining shortages to the Emergency Health Service.

C. The Emergency Health Service will identify areas of potential health manpower supply and notify health officials of those areas to arrange reassignment of needed numbers and categories. Simultaneously, EHS will request the State Manpower Service to use its interarea

*"List of Health Manpower Occupations" is not attached to this Model Plan; it is published in "Community Emergency Health Manpower Planning," PHS Publication No. 1071-I-1.
**Not attached to this Model Plan.

recruitment machinery to obtain the needed personnel and complete the referral arrangements with the community(ies) requesting manpower. EHS will report remaining shortages to the Regional Emergency Health Chief, DHEW.

D. The State Manpower Service will use its resources to assist in locating and mobilizing health manpower and will provide supporting manpower as necessary and possible in accordance with existing priorities.

REPORT TO FEDERAL EMERGENCY HEALTH SERVICE

An initial health situation report, and subsequent reports of situation changes, shall be submitted by the State Health Officer to the Federal Emergency Health Service Regional Office (DHEW Regional Health Director). Reports may be submitted by any available communication method. It is mandatory that the data code be included with each reported item; the descriptive headings, however, may be omitted. Compliance with this reporting procedure will help to expedite Federal assistance.

Data Code	Description	Estimated Current Total Number
A1	Sick and injured requiring: hospital inpatient care	
A2	outpatient care	
	Inpatient conditions:	
A1.1	traumatic injuries	
A1.2	infections	
A1.3	burns	
A1.4	radiation illness

B	Available hospital beds (including temporary and improvised facilities)	
C	Available physicians (MD & DO)	
D	Brief narrative description, including prevalence, of major health and medical problems (e.g., epidemic, undiagnosed disease) _____ _____	

EXAMPLE

REQUESTS FOR FEDERAL EMERGENCY HEALTH SERVICE ASSISTANCE

GENERAL

The effectiveness of emergency preparations and plans will be tested at the local level. During the crucial first postattack month the numbers of lives saved and health hazards eliminated will depend largely upon individual, local, and State actions and available resources. As rapidly as postattack conditions permit, the Federal Emergency Health Service will be established and expanded at relocated regional offices. Though Federal EHS programs are most likely to be concerned with long-term national recovery, the primary mission is to provide assistance to State Health Departments. State requests for Federal EHS assistance shall be directed by the State Health Officer only to the Federal EHS Regional Office (DHEW Regional Health Director) having jurisdiction.

ASSISTANCE

Following are some of the types of assistance to be made available to the States.

1. Allocation of Federally-controlled civilian health resources (producer inventories and new production of health and medical supplies and equipment; stockpiled medical supplies and equipment)
2. Assignment of personnel to assist in re-establishment of State Health Departments
3. Establishment of regional specialized treatment and rehabilitation centers
4. Financial assistance (training and reconstruction grants)
5. Assistance in obtaining essential supporting services and resources
6. Assistance in resolving interstate conflicts and problems
7. Requisitioning and interstate movements of health resources
8. Professional and technical consultation and advice

EXAMPLE

Requests for military assistance should be directed to the State Adjutant General. Federal legislative needs should be brought to the attention of members of Congress and the Surgeon General of the PHS.

PROCEDURE

State Health Officer requests for Federal EHS assistance may be transmitted to the DHEW Regional Health Director by any available method of communication. Response to such requests will be facilitated if full information is provided on:

1. Specific assistance needed
2. Amount
3. Location of need (if other than State Health Office)
4. Magnitude of problem
5. Relative urgency
6. Justification (estimate of remaining available supply)

Information previously reported to DHEW in health situation reports need not be repeated; additional details, however, should be provided.

LICENSURE REQUIREMENTS AND LIABILITY

TO : State Health Officer

FROM : Governor

SUBJECT: WAIVING LICENSURE REQUIREMENTS AND CONFERRING IMMUNITY FROM LIABILITY FOR HEALTH PERSONNEL PERFORMING EMERGENCY HEALTH SERVICES

By virtue of the emergency powers vested in me as Governor of the State of_____, it is hereby ordered as follows:

Section 1. Scope. This order applies to Health Manpower as listed in Defense Mobilization Order 8540.1 Health Manpower Occupations, and published in the Federal Register of March 18, 1964.

Sec. 2. Waiver of Licensure Requirements. Any requirement for a State license to practice a health or allied skill shall not apply to a practitioner duly licensed by any other State, territory, possession, the District of Columbia, Federal government, or any neighboring country and performing emergency health services in this State subject to the order, or control of, or pursuant to a request of the State government, or any political subdivision thereof.

Sec. 3. Immunity. No person within the scope of this order performing emergency health services in this State shall be liable for the death of or injury to persons or damage to property as the result of such activity, except in cases of willful misconduct, gross negligence, or bad faith. The provisions of this Section shall not affect the right of any person to receive benefits to which he would otherwise be entitled under the Workmen's Compensation Law, or under any pension law, nor the right of any such person to receive any benefits of compensation under any Act of Congress.

/s/ GOVERNOR

EXAMPLE

REPORTING FOR EHS DUTY

TO : All Civilian Health Manpower

FROM : State Health Officer

SUBJECT: REPORTING FOR EMERGENCY HEALTH SERVICE DUTY

All civilians classified as health manpower* - regardless of present occupation - are hereby directed and authorized to report, to one of the following as soon as radiation levels permit:

1. Their emergency assignments
2. The nearest hospital, laboratory, or city, county, or state health officer
3. The nearest State Employment Service office for a health service assignment.

In localities where there are no extraordinary health or medical problems, health personnel will stand by either to receive sick and injured from hard-hit areas or to go, when directed to do so, to localities where health skills are critically needed.

This Order is issued because it is necessary to centralize health services activities and to coordinate, control, and conserve health resources to deal effectively with effects of the attack.

*If you are not sure whether or not you are classified as being in a health manpower occupation, contact the local health officer or employment service, both of whom have the official List of Health Manpower Occupations.

EXAMPLE

BY ORDER OF THE GOVERNOR /s/ STATE HEALTH OFFICER

Distribution: To all public information media (newspapers, radio stations) for immediate release, local health officers, and State Employment Service offices.

REQUISITION OF HEALTH MANPOWER

TO : Mayor of Metro City
Attention: Health Officer

FROM : State Health Officer

SUBJECT: REQUISITION FOR HEALTH MANPOWER

You are hereby directed to select and dispatch the following health manpower:

No. and Type:	Five (5) Bacteriologists (preferred: 3 medical, 2 food)
Send to:	Health Officer, Farnsworth
Via:	Helicopter, departs Metro City Heliport, Sept. 2, 19-- 8:00 a.m.
Duration of Duty:	About two months
No. and Type:	Five (5) Physicians (M.D. or D.O.) (Preferred specialties: 2 orthopedists, 2 surgeons, 1 psychiatrist) Ten (10) Registered Nurses One (1) Medical Record Librarian
Send to:	Health Officer, St. Vincent
Via:	MATS flight, departs Metro City Airport, Gate 5, Sept. 2, 19-- 9:15 a.m.
Duration of Duty:	About two weeks

EXAMPLE

This order is issued because an adjustment in the distribution of health manpower is imperative to deal with the effects of attack upon this State and upon the nation. To be effective and as equitable as possible, redistribution is based on established utilization standards and ratios, and will be accomplished by imposing quotas on each political subdivision able to contribute health manpower.

BY ORDER OF THE GOVERNOR /s/ STATE HEALTH OFFICER

Distribution: 30 copies to addressee; 2 copies to Health Officer, Farnsworth; 2 copies to Health Officer, St. Vincent; 11 copies to Transportation Office; 6 copies to Health Manpower Branch.

RETAIL SALE AND DISTRIBUTION OF DRUGS

TO : Pharmacists, Local Health and Civil Defense Officers, Retail Establishments, and General Public

FROM : State Health Officer

SUBJECT: REGULATIONS GOVERNING RETAIL SALE AND DISTRIBUTION OF DRUGS AND MEDICAL ITEMS

PURPOSE

This Order regulates the sale and distribution of drugs and medical supplies by retail establishments. It is effective immediately upon issuance of a General Freeze Order by the Governor.

EXAMPLE

REPORTING FROZEN STOCKS

Stocks of health survival items in food stores, department stores, and other retail establishments which do not employ a licensed pharmacist, or other acceptable health professional, shall be immediately frozen and reported to the local health officer.

DRUGS

Retail establishments employing a licensed pharmacist, or other health professional, may sell life-saving drugs (e.g., insulin, hydrocortisone, digitalis, isoproterenol) to patients normally under the care of a physician if:

(1) denial of such drug may jeopardize the patient's life,

(2) request is for a prescription drug and the person has a refillable prescription, or

(3) quantity sold is limited to one-week supply, except where the smallest unit is more than one-week supply (e.g., injectables), in which case the smallest unit may be dispensed.

BY ORDER OF THE GOVERNOR /s/ STATE HEALTH OFFICER

REPORT OF ESSENTIAL HEALTH SURVIVAL ITEMS IN RETAIL ESTABLISHMENTS AND NOT UNDER SUPERVISION OF A PHARMACIST

TO : Chief, Local Emergency Health Service

FROM: Department Store

EXAMPLE

In accordance with the Governor's general rationing order and Emergency Health Service Order No._____, requiring a registered pharmacist or other health professional to distribute essential health survival items, the items listed below have been frozen and will be made available from this location for redistribution on receipt of your instructions.

Description of Item	Unit of Measure	Total Quantity
Aspirin	Btle 25's	100
Aspirin	Btle 100's	50

/s/ MANAGER

LOCAL ASSIGNMENT OF DESTINATIONS FOR FROZEN STOCKS OF ESSENTIAL HEALTH SURVIVAL ITEMS

TO : Food Store or Department Store, etc.

FROM: Chief, Local Emergency Health Service

CONTROL NUMBER 102

The health survival items reported below as frozen and available are allocated to the following destinations in the quantities indicated:

Ship to: Charity Hospital, 42 State Street, Centerville.

Description of item	Unit of measure	Quantity
Aspirin	Bottle 25's	50

EXAMPLE

Priority has been assigned to this shipment. Transportation for movement will be furnished by the Red Ball Express Co., May 18 at 9:00 a.m. Have the supplies ready for movement at that time.

Standard commercial bill of lading will be used for shipment. Submit accomplished bill of lading to the Emergency Transportation Office for reimbursement. A copy of this order must be retained and presented with the consignee's signed statement of receipt to claim reimbursement.

/s/ COUNTY HEALTH OFFICER

cc: Red Ball Express Co.
Charity Hospital

ESTIMATE OF EMERGENCY HEALTH SERVICE RESOURCE REQUIREMENTS

TO : Federal Regional Emergency Health Service

FROM : State Emergency Health Service

SUBJECT: ESTIMATE OF EMERGENCY HEALTH SERVICE RESOURCE REQUIREMENTS

Following are this State's estimated net requirements for health supplies and equipment and other essential survival items necessary for the provision or support of civilian emergency health services during the 90-day period beginning_____. The listing is arranged in accordance with OEP Defense Mobilization Order 8500.1A.

Item	Unit of Measure	Estimated Net Requirement		
		30 days	60 days	90 days
(1)	(2)	(3)	(4)	(3) + (4)

EXAMPLE

I. HEALTH SUPPLIES AND EQUIPMENT*

1. Pharmaceuticals
2. Blood Collecting and Dispensing Supplies
3. Biologicals
4. Surgical Textiles
5. Surgical Instruments and Supplies
6. Laboratory Equipment and Supplies

II. FOOD

III. BODY PROTECTION AND HOUSEHOLD OPERATIONS

IV. ELECTRIC POWER AND FUELS

V. SANITATION AND WATER SUPPLY

VI. EMERGENCY HOUSING AND CONSTRUCTION MATERIALS AND EQUIPMENT

VII. GENERAL USE ITEMS

*Estimate military requirements, if any, separately.

LOCAL REQUEST FOR STATE EHS ASSISTANCE IN OBTAINING HEALTH END-ITEMS FOR PUBLIC CONSUMPTION

TO : State Emergency Health Service

FROM : Chief, Local Emergency Health Service

SUBJECT: HEALTH END-ITEM REQUIREMENTS FOR PUBLIC CONSUMPTION

Inventories of health end-items in this county have been depleted to the point at which they are inadequate to meet present and anticipated public consumption requirements for the maintenance of personal health and home sanitation.

There are six operational pharmacies with a licensed pharmacist on duty at each. They are normally supplied by two wholesale warehouses, one of which has been damaged beyond repair.

We request the following essential survival items be made available to this county. Quantities represent a 14-day operating supply.

EXAMPLE

Item	Unit of Issue	Quantity
Insulin	Box	
Bandage, Conpress 6X6	Pkg	
Antibiotics		

Ship to Central Wholesale Warehouse, 22 Peachtree Street, Centerville.

/s/ COUNTY HEALTH OFFICER

cc: Central Wholesale Warehouse

PROCUREMENT OF HEALTH END-ITEM SUPPLIES

TO : Health Facility Operators, Health End-Item Wholesalers and Retailers, Local Health and Civil Defense Officers

FROM : State Health Officer

SUBJECT: REGULATIONS GOVERNING ESSENTIAL HEALTH FACILITY PROCUREMENT OF HEALTH END-ITEM SUPPLIES

PURPOSE

This regulation authorizes and prescribes procedures for the procurement of health end-item supplies by essential health facilities.

AUTHORIZATION

Any person who operates an essential health facility may certify purchase orders for health survival items required to maintain essential emergency health services for 14 days.

EXAMPLE

CERTIFICATION

Purchase orders shall be certified as follows:

> "Certified for use in essential health survival activity under State Emergency Health Service Order No._____."
>
> /s/ Purchaser

SUPPLIERS

Purchase orders shall be placed with regular retail or wholesale supply sources. Delivery orders for supplies allocated from new production, or from producer inventories, shall bear the allocation number and the above certification statement.

RECORDS

Each person involved in any transaction covered by this regulation shall make and preserve records in sufficient detail to permit later determinations of compliance and reimbursement.

BY ORDER OF THE GOVERNOR /s/ STATE HEALTH OFFICER

LOCAL REQUEST FOR STATE EHS ASSISTANCE IN OBTAINING EMERGENCY OPERATING SUPPLIES

TO : State Emergency Health Service

FROM : Chief, Local Emergency Health Service

SUBJECT: REQUEST FOR EMERGENCY OPERATING SUPPLIES

Inventories of health end-items are inadequate to meet present and anticipated hospital needs. —— burn and —— orthopedic inpatients are now in critical condition. The following items are urgently requred to maintain a 14-day operating capability.

Item	Unit of Issue	Now On Hand	Quantity Required
Blankets			
Penicillin			
Dressings			
Insulin			
Morphine			
Sterilizer			

EXAMPLE

Supporting supplies (specify)
Dietary equipment
Refrigeration equipment
Fire Prevention equipment
Motorized equipment
Housekeeping equipment
Office equipment
Laboratory equipment
Sterilizing equipment
Laundry equipment
X-ray and photographic equipment
Food and water

Ship to Sussex County Memorial Hospital, 312 West Street, Centerville.

/s/ COUNTY HEALTH OFFICER

cc: Sussex County
Memorial Hospital

PROCUREMENT OF SUPPORTING MATERIALS AND SERVICES

TO : Health Facility Operators, Local Health and Civil Defense Officers, Supporting Supplies and Equipment Wholesalers and Retailers

FROM : State Health Officer

SUBJECT: REGULATIONS GOVERNING ESSENTIAL HEALTH FACILITY PROCUREMENT OF SUPPORTING MATERIALS AND SERVICES

PURPOSE

This regulation authorizes and prescribes procedures for the procurement of maintenance, repair, and operating supplies; installation materials, capital equipment, controlled materials, and supporting services required to maintain continuity of essential health service operations.

EXAMPLE

AUTHORIZATION

Essential health facilities may certify purchase orders for materials and services covered by this regulation as follows:

> "Certified for use in essential health services facility under State Emergency Health Service Order No._____."
>
> /s/ Purchaser

DELIVERIES

Any delivery order for materials and services shall bear the above certification statement.

RECORDS

Each person involved in any transaction covered by the regulation shall make and preserve records in sufficient detail to permit later determination of compliance and reimbursement.

BY ORDER OF THE GOVERNOR /s/ STATE HEALTH OFFICER

APPLICATION FOR HEALTH FACILITY CONSTRUCTION, REPAIR, AND MODIFICATION

TO : State Emergency Health Service

FROM : Chief, Local Emergency Health Service

SUBJECT: APPLICATION FOR HEALTH FACILITY CONSTRUCTION, REPAIR, AND MODIFICATION

The attached applications for health facility construction, repair, and modification have been reviewed and approved as required to maintain health and medical care operations in this jurisdiction for the next 90 days.

EXAMPLE

JUSTIFICATION

The present population of this jurisdiction is about _____, compared to a preattack population of _____. The total number of postattack deaths is about _____. We are currently serving a casualty population of about _____ sick and injured persons (of which _____ require inpatient care and _____ outpatient care). Of the preattack total of _____ beds, only _____ hospital beds are now available. Other health facilities included among the attached applications are _____ Public Health Clinics required to provide minimum preventive health services. Hospital construction requirements are based on 75 square feet per inpatient bed (food and laundry facilities excluded).

Locally available and controlled resources required for accomplishment of these projects have been exhausted. State assistance is required.

/s/ COUNTY HEALTH OFFICER

HEALTH SERVICE ESSENTIAL FACILITY CONSTRUCTION REPORT

TO : State Emergency Construction Agency

FROM: State Emergency Health Service

Attached is a list of the construction, repair and modification of health facility projects required to maintain an approved level of health and medical care operations during the 90-day period commencing today.

Locally available materials have been committed for essential services projects. There are no materials available in this area for these projects.

/s/ STATE HEALTH OFFICER

HEALTH FACILITY CONSTRUCTION REQUIREMENTS REPORT

EXAMPLE

Project Number	Name of Facility	Location	Type	No. of Beds	Schedule of Construction	
					Started	Completion
1	(Repair) Brown Memorial Hospital	1121 Vortex Street, Illiad	General	100	4/10/65	7/18/65
2	(Conversion) Mercer County Health Center	25 Main St. Mercer	Outpatient Clinic	2	5/4/65	7/5/65

Attachments (for each project):

1. Statement of need (medical workload)
2. Summary bill of materials
3. Time-phased material requirement (proposed accelerated construction, repair, or modification)
4. Special problems and assistance required to accomplish item 3 above
5. Construction contract (if project has been started)

CHECK LIST OF CHANGES AND ADDITIONS TO STATE EMERGENCY HEALTH SERVICE PLAN

This Plan is issued in loose-leaf form to facilitate maintenance and insertion of subsequent changes and additions. Supplementary materials will be issued by numbered transmittal notice. Each notice will describe the new material being transmitted, old material superseded, and other actions required for maintenance of the Plan. Upon receipt of a transmittal notice, check its number against the number of the last previous notice to assure that no notices are missing, make the specified changes and insertions, and post the number and date of the transmittal notice on the following check list. When kept current, this check list enables to the Plan holder to determine quickly if any transmittals are missing.

PREFACE

This bulletin is designed to assist school board members, school administrators and other educators who are interested in the preparation of students seeking education for careers in office occupations. The Vocational Education Act of 1963, and, subsequently, the State Plan for the Administration of Vocational Education under the Vocational Education Acts, have provided many new opportunities for broadening Vocational Education, including Business and Office Education programs in the State of Illinois. This bulletin outlines the minimum requirements which are derived from the above Act and State Plan.

Illinois Public School districts responsible for the administration of secondary and adult education desiring additional information regarding the Vocational Office Education programs and the requirements as set forth in this bulletin should direct their inquiry to Business and Distributive Education Service, State Board of Vocational Education and Rehabilitation, 405 Centennial Building, Springfield, 62706.

This publication supersedes the following:

Bulletin No. 142 September 1953 - How to Organize and Establish Part-Time Business Occupations Programs

Bulletin No. 182 - September 1961 - Suggested Minimums for an Office Occupations Program

Interim Bulletin "Vocational Business Education Programs in the Secondary Schools". Expiration date June 30, 1965

Interim Bulletin "Adult Vocational Business Education Programs". Expiration date June 30, 1965

PART I

GENERAL ADMINISTRATIVE INFORMATION [1]

Objective of Instruction - Vocational Office Education programs under the State Plan shall be designed to meet the needs of persons over 14 years of age, (a) who have entered or are preparing to enter business and office occupations, or (b) who have entered or are preparing to enter an occupation for which instruction in business and office education subjects will make a contribution to employability.

Office Occupations means those occupations pursued by individuals in public or private enterprises or organizations which are related to the facilitating functions of the office and includes such activities as recording and retrieval of data, supervision and coordination of office activities, internal and external communication, and reporting of information.[2]

Vocational Office Education classes at the 11th and 12th grade level, either cooperative part-time or in-school (non-cooperative), may be established in any recognized public secondary school. Classes in a vocational business education program may consist of the following, but not limited to: Cooperative Office Occupations, Secretarial-, Clerical-, Office-Practice, Business Data Processing, Typewriting, Shorthand, Bookkeeping, and Office Machines. All classes for which reimbursement from vocational funds is claimed will be evaluated mainly on the basis of course work, supervised practical experiences, time requirements, teacher and pupil qualification and equipment and facilities. Not more than 10% of the enrollment of any of the classes for which reimbursement is requested may consist of students who can be expected to attend college to obtain a baccalaureate degree.

Non-Reimbursable Classes - Reimbursement from vocational funds is not available for instruction of classes considered as general education, or leading to an occupation requiring a baccalaureate or higher degree.

The Career Objective of the student is to be recorded in terms of the Dictionary of Occupational Titles, D.O.T. number (see appendix) for Office Education In-School and Cooperative Office Occupations programs.

---

[1] This page revised January 1, 1966

[2] Part 104 - Administration of Vocational Education: Federal Allotments to States. Rules and Regulations, U. S. Department of Health, Education and Welfare, Office of Education Federal Register August 28, 1964.

Schools which may be approved for reimbursement - Any recognized public secondary school may be approved to organize a vocational office education program and be eligible for reimbursement provided the school meets the requirements of the State Plan.

Requirements for Equipment and Facilities - Provision shall be made for classroom facilities, equipment and reference materials suitable to the needs of the students and to the requirements of those office occupations for which they are preparing. Equipment and facilities will be re-approvable each year, on the basis of changes in the occupational standards and opportunities.

Instructional Equipment and Durable Teaching Aids - The State Board may use surplus monies to reimburse up to 50% on purchases of any new instructional equipment and durable teaching aids necessary for a program. Items of equipment costing over $100 per unit are not reimbursable except by special action of the State Board.

Special programs - Research, Pilot, Experimental or Demonstration, Work-Study or Interrelated Instructional Programs involving vocational office education are especially planned and administered, and because of their limited number are not included in this bulletin. Inquiry concerning these programs should be made to the Chief of Business and Distributive Education Service.

Vocational Youth Organizations shall be an integral part of the instructional program. The activities of the local vocational office education youth organizations are to complement the vocational instruction and shall be supervised by the approved vocational teacher. The allocation of time for the program of youth activities shall be the responsibility of the local school administration.

Approved Travel for teachers and teacher-coordinators is to be reported on Form Bus. 38. Transportation expenses will be reimbursed on the total amount of actual expenditures paid by the school, necessary in carrying out the program of vocational education. Mileage shall not exceed 8¢ per mile or the actual cost of transportation by public conveyance. Lodging (not to exceed $8.00 per night), and transportation will be reimbursed for meetings called by the State Office and approved by the State Director, and for the annual meeting of the Illinois Vocational Association.

A copy of the Monthly Report of Coordination Activities, Form Bus.24 is to be submitted to this office by each approved teacher-coordinator of Cooperative Office Occupations programs. Forms are available from this office.

MINIMUM REQUIREMENTS - APPLICABLE TO ALL REIMBURSABLE OFFICE EDUCATION PROGRAMS

Organization and content
The program of instruction will be based on a consideration of the skills and knowledge required in the occupation for which the instruction is being provided, and will include a planned logical sequence of those essentials of education and/or experience deemed necessary for the individual to meet his occupational objective.

Counsel and advice
The program of instruction will be developed and conducted in consultation with potential employers and other individuals or other groups of individuals having skills in and substantive knowledge of the occupation or occupational field representing the occupational objective.

Up-to-date instruction
The program of instruction will include the most up-to-date knowledge and skills necessary for competencies required in the occupation or occupational field in which the individual is being prepared, or upgraded, or updated.

Duration and intensity of instruction
The program of instruction will be sufficiently extensive in duration and intensive within a scheduled unit of time to enable the student to develop competencies necessary to fit him for employment in the occupation or occupational field for which he is being trained.

Supervised practical experiences, which are a mandatory feature of all vocational educational programs, are to be included in the course outline. Simply stated, supervised practical experiences are the application of skills and knowledges in a shop, laboratory, classroom or on the job. Individual, team, or group projects related to the skills and knowledges involved in the occupation may be used.

PART II

I. VOCATIONAL IN-SCHOOL OFFICE EDUCATION PROGRAMS

(1) Instruction. The program of instruction shall be based on the skills and knowledges required in the occupation for which the instruction is being provided. Vocational in-school class instruction shall provide for supervised practical experiences.

(2) Time Requirements:

A. Courses of two or more years in length shall have 275 minutes per week scheduled for class group instruction.

B. Courses of less than two years in length shall have 550 minutes per week scheduled for class group instruction, OR

275 minutes per week if the students have had previous experience in the occupational field, or class instruction related to the occupational field, OR

550 minutes per week of which 275 minutes may be in a concurrent class related to the occupational field.

QUALIFICATIONS OF IN-SCHOOL OFFICE EDUCATION TEACHERS

Basic Education: He shall hold a valid teaching certificate.

Technical Subject Matter Courses in Office Education. He shall have completed (20) semester hours of college credit in technical courses in the field of office education, 12 hours of which are to be in GROUP 1-A or 1-B, and eight semester hours in GROUP 2 divided, with a minimum of one course in each area, as follows:

GROUP 1-A: Secretarial or Stenographic Emphasis

12 semester hours	) - Typewriting	one course
	) - Business Machines	one course
	) - Shorthand	one course

(and eight of which are in at least two of the subject matters of GROUP 2 below OR,

GROUP 1-B: Clerical or Office Machines Emphasis

12 semester hours	) - Typewriting	one course
	) - Business Machines	one course
	) - Data Processing	one course

AND,

GROUP 2:

8 semester hours	) - Accounting) - Business Law) - Personnel Relations	(a minimum of two subject matter areas to be represented)

Professional Office Education:

He shall have completed 8 semester hours of college credit in approved office education courses. Such courses emphasize the organization and administration of vocational office education courses.

Experience in Office Occupations:

He shall have two years of accumulative experience as an employee in one or more office occupations, OR

He shall have one year of accumulative experience as an employee in one or more office occupations, AND,

one course of college grade in office education taken in conjunction with a directed occupational program, OR

He shall have six months of accumulative experience as an employee in one or more office occupations, AND

one course of college level in office education taken in conjunction with a directed occupational experience program, AND

an approved research project directly related to education for office occupations.

Teachers seeking approval as a vocational qualified office education teacher or teacher-coordinator should arrange to have an official transcript of record sent to the Chief, Business and Distributive Education, Vocational and Technical Education Division, State Board of Vocational Education and Rehabilitation, 405 Centennial Building, Springfield, Illinois, 62706, Social Security number to be included.

In addition, the teacher will need to supply a statement pertaining to his experience in office occupations. Names and addresses of establishments, owners or managers, duties and responsibilities and dates of employment, inclusive, are to be included. (Part-time employment is to be expressed in hours per week or month.)

CONDITIONAL APPROVAL OF INSTRUCTIONAL PERSONNEL

Conditional approval of qualifications may be granted for instructional personnel who indicate a definite plan for meeting requirements for full approval. Such approval may be granted for a period not to exceed 3 years in length. Teachers seeking conditional approval are requested to submit a statement as to their intentions for meeting the above requirements.

PART III

I. VOCATIONAL COOPERATIVE OFFICE OCCUPATIONS PROGRAM

1. The Cooperative Part-Time Office Occupations Program is a program in vocational education preparing secondary school youth for successful employment in office occupations. Office Occupations include, but are not limited to: secretarial, stenographic, and clerical positions, records management, business machine operations, accounting and bookkeeping, and office supervision and management.

The term "cooperative," as used here, defines the working agreement between the school and the local business establishments providing learning experiences for each program student-learner through part-time employment. Under this arrangement, planned and supervised occupational experiences in an authentic office environment are supplemented with in-school daily classroom instruction directly related to the part-time office occupation chosen by each student learner.

Cooperative Office Occupations programs are those in which all students shall identify realistic and relevant career objectives and shall receive on-the-job training for not less than 15 hours per week, half of which must be during the regularly scheduled school day OR during added time when the qualified teacher-coordinator is assigned the responsibility for supervision.

A teacher-coordinator of a cooperative program is the approved teacher who teaches the class and also coordinates the class work of the student-learner with his on-the-job experiences. A cooperative office occupations program may be one or two years in length.

2. Time Requirements - Cooperative Office Occupations Programs

A. Two year Program - 200 minutes per week scheduled for class group instruction by teacher-coordinator

B. Program of less than two years in length consisting of 200 minutes per week scheduled for class group instruction by teacher-coordinator, AND

previous experience in occupational field, OR

previous class instruction related to the occupational field, OR

200 minutes per week in a concurrent class related to the occupational field.

MINIMUM REQUIREMENTS - COOPERATIVE OFFICE OCCUPATIONS PROGRAMS

A. Minimum age requirements

Enrollees shall be of legal age for employment. The employment shall comply with State and Federal employment regulations and shall consist of a minimum of 15 hours per week of on-job training.

Agreement between school and employer

There shall be a training memorandum between the local school and the employing establishment which shall include the interrelationship and responsibilities of the student-learner, teacher-coordinator and the training establishment.

On-the-job training program

The course of instruction for each student-learner on the job is to be in the form of a step by step training plan which is in turn derived from a realistic analysis of the tasks, duties and responsibilities of the student-learner and his part-time occupation. The step by step training plan shall indicate what is to be learned and whether it is to be taught in the classroom or on the job.

Nonexploitation for private gain

The student-learner shall be paid a beginning wage comparable to that paid other learners in similar occupations, and all phases of employment shall be in conformity with applicable Federal and State regulations. The amount of time spent in school and on the approved job by the student-learner shall not exceed 40 hours per school week. The responsibility for the welfare of the student-learners rests in the hands of the local school administration.

Related Instruction

The content of the instructional material is to be selected on the basis of the objectives of the program and is the joint responsibility of the local board of education, the school administrator, and the teacher-coordinator. Periodic evaluations of the progress of the program are to be made by a State Supervisor.

Credit - Credit shall be given in recognition of both parts of the program, that is, for successful completion of the step-by-step training plan, (1) in the school, and (2) at the training station. The amount of credit to be given shall be determined by the school but it shall be comparable to the credit given for similar courses achieving similar standards and developing similar responsibilities.

QUALIFICATIONS OF A TEACHER-COORDINATOR OF COOPERATIVE OFFICE OCCUPATIONS PROGRAMS

Basic Education: He shall hold a valid teaching certificate.

Technical Subject Matter Courses in Office Education.

He shall have completed (20) semester hours of college credit in technical courses in the field of office education, 12 hours of which are to be in GROUP 1-A or 1-B, and eight (8) semester hours in GROUP 2 (with a minimum of one course in each area, divided as follows:

GROUP 1-A: Secretarial or Stenographic Emphasis

12 semester hours	- Typewriting	one course
	- Business Machines	one course
	- Shorthand	one course

(and eight of which are in at least two of the subject matters of Group 2 below)

OR, GROUP 1-B: Clerical or Office Machines Emphasis

12 semester hours	- Typewriting	one course
	- Business Machines	one course
	- Data Processing	one course

AND, GROUP 2:

8 semester hours	- Accounting	(a minimum of two subject matter areas to be represented)
	- Business Law	
	- Personnel Relations	

Professional Office Education

He shall have completed 8 semester hours, of which one course shall be in the field of cooperative office education methods.

Experience in office occupations:

He shall have two years of accumulative experience as an employee in one or more office occupations.

B. Qualifications of Cooperative Office Occupations Program Enrollees

Students may apply for enrollment in their school's Office Occupations program when:

a. They have indicated a career goal in the field of office occupations.

b. They have an aptitude for the type of office occupation they wish to enter.

c. They can profit from classroom instruction and supervised practical experiences.

d. They have satisfactorily completed all work for entrance into the last two years of high school.

e. They are at least sixteen years of age.

f. They have an acceptable attendance record.

g. They have acceptable character and personality traits.

h. They are physically fit to undertake an office occupation.

PART IV.

VOCATIONAL ADULT OFFICE EDUCATION CLASSES.

1. The objectives of the Adult Office Education program of courses (or the single course) are to provide the adult with a combination of skills and knowledges which will make him employable. Vocational Adult Office Education classes may be organized for persons over 16 years of age who are interested in business and office occupations. The sizes of classes are the responsibility of the local school administration.

Types of classes:

Preparatory classes are for those adults who (1) are unemployed, (2) are capable of profiting from instruction as indicated by aptitude tests or a demonstration of ability, and (3) who can be expected to complete the program of instruction which leads to employment. (Preparatory instruction is the first of a sequence of courses.) Skill courses such as typewriting and shorthand must consist of a minimum of 40 clock hours.

Supplemental classes are for those adults who (1) have had adequate preparatory instruction, (2) are employed or self-employed and are seeking improvement, and (3) who can profit from instruction. (Supplementary courses may be the intermediate or terminal courses of a sequence or they may be isolated courses, such as "refresher" or specialized courses developed for a particular need.)

Supervised practical experiences, which are a mandatory feature of all vocational educational programs, are to be included in the course outline. Simply stated, supervised practical experiences are the application of skills and knowledges in a shop, laboratory, classroom or on the job. Individual, team, or group projects related to the skills and knowledges involved in the occupation may be used.

2. HOW TO REPORT VOCATIONAL ADULT OFFICE EDUCATION CLASSES

The instructor is to be selected on the basis of educational and occupational achievements, and recommended for the position by the local department chairman, supervisor, director or administrator.

The Adult Teacher's Record and Approval Form, B-14 (see appendix) is to be completed in duplicate. An approved copy will be returned to the school. An instructor may be approved to teach more than one course.

Approved Adult classes are to be reported on Form Bus. 26 Adult Course Plan and Membership List. Two copies of Form Bus.26 are to be completed and forwarded to this office within 10 days following the first class meeting.

The enrollees of adult classes are to be recorded on Form. Bus.26 according to their career objectives, as well as their place of employment, and job title, if employed. Adult classes are to be "homogeneous," i.e., all adults with office career objectives in one class.

Office Education classes are to be reported according to the system used in the Dictionary of Occupational Titles (D.O.T. number).

3. REIMBURSEMENT OF VOCATIONAL ADULT OFFICE EDUCATION PROGRAMS

The instructional costs of Adult classes will be reimbursed on the basis of the salary submitted and approved on Form Bus.26. (Any travel of instructors of adult classes which is directly related to the program or career must be estimated and added to Form Bus. 26).

The reimbursement of the Vocational Adult Office Education Programs will be made at the end of the 1965-66 school year on forms which will be sent to participating schools at a later date.

PART V

APPLICATION AND REIMBURSEMENT PROCEDURES
(Vocational Office Education)

A. SECONDARY SCHOOL PROGRAMS (Cooperative or In-School)

	Originating Source:	Title and number	Copies	Due Date
1.	Local Board of Education (Forms sent to Superintendents approximately September 15 or on request)	Application for Approval of Vocational Education Programs (Form VE-1) (white)	(2)	October 15
2.	A local administrator or teacher candidate	(a) Teacher's transcript of Record (loaned) (b) Statement of occupational wage-earning experience	(1)	Before any program begins
3.	A local administrator (Forms sent to Superintendent approximately September 15 or on request)	Annual Information Report Form VE-2 Bus. (pink)	(2)	October 15 (July 1 for summer schools)
4.	Teacher-Coordinator (Forms available from State Office)	Monthly Report of Coordination activities Form Bus. 24 (pink)	(1)	10th of following month
5.	Teacher-Coordinator	Letter pertaining to atypical placements of cooperative student-learners	(1)	Before placement is made
6.	School Superintendent (Forms sent approximately May 15)	Financial Report Form Form VE-33 Bus. O. E. (pink)	(2)	Approximately June 1
7.	School Superintendent (Forms sent to schools of record, approximately May 15)	Vocational Business Education Travel Reimbursement (Form Bus.38) (pink)	(1)	Approximately June 1
8.	School Superintendent (Forms sent approximately May 15)	Annual Application for Reimbursement Form VE-3 Bus. O.E. (pink)	(2)	Approximately June 1
9.	School Superintendent (Forms sent approximately May 15)	Annual Report for Reimbursement for Instructional Equipment and Durable Teaching Aids Form VE-30 (white)	(2)	Approximately June 1

B. ADULT EDUCATION PROGRAMS (Preparatory or Supplementary)

OFFICE OCCUPATIONS

14.0000

The body of subject matter, or combinations of courses and practical experience, organized into programs of instruction to provide opportunities for pupils to prepare for and achieve career objectives in selected office occupations. In the instructional process substantive content frequently is comprised of subject matter drawn from other subject matter areas. Learning experiences are designed to lead to employment and/or advancement of individuals in occupations in public or private enterprises or organizations related to the facilitating functions* of the office. Included is a variety of activities, such as recording and retrieval of data, supervision and coordination of office activities, internal and external communication, and the reporting of information. Under this heading are the items of information which identify categories of career objectives in office occupations, and around which courses and practical experiences are developed.

0100 Accounting and Computing -- Planned learning experiences which include a combination of courses and practical experiences concerned with systematizing information about transactions and activities into accounts and quantitative records, and paying and receiving money. Career objectives are identified with a variety of occupational groups and specialization, (as indicated in the Dictionary of Occupational Titles), such as Junior Accountants, Bookkeepers, Cashiers, Machine Operators, Tellers, and Other Accounting and Computing occupations.

0200 Business Data Processing Systems -- Planned learning experiences which include a combination of courses and practical experiences concerned with business data processing systems and operations. Career objectives are identified with a variety of occupational groups and specialization, (as indicated in the Dictionary of Occupational Titles), such as Computer and Console Operators, Peripheral Equipment Operators, Programmers, Systems Analysts, and Other Business Data Processing Systems Occupations.

0300 Filing, Office Machines, and General Office Clerical -- Planned learning experiences which include a combination of courses and practical experiences concerned with the recording and retrieval of data, including classifying, sorting, filing, correspondence, records, and other data.

---

* "Facilitating function", as used in Office Occupations Education, refers to the expediting role played by office occupations as the connecting link between the production and distribution activities of an organization.

Career objectives are identified with a variety of occupational groups and specialization (as indicated in the Dictionary of Occupational Titles), such as Duplicating Machine Operators, File Clerks, General Office Clerks, and Other Filing, Office Machines, and General Office Clerical Occupations.

0400 Information Communication -- Learning experiences which include a combination of courses and practical experiences concerned with the distribution of information, e.g., by mail, telephone, telegraph, and in person. Career objectives are identified with a variety of occupational groups, (as indicated in the Dictionary of Occupational Titles), and specialization such as Communication Systems Clerks and Operators, Correspondence Clerks, Mail and Postal Clerks, Mail-preparing and Mail-handling Machine Operators, Messengers and Office Boys and Girls, Receptionists and Information Clerks, and Other Information Communication Occupations.

0500 Materials Support Occupations: Transporting, Storing, and Recording -- Planned learning experiences which include a combination of courses and practical experiences concerned with (1) receiving, storing, issuing, shipping, requisitioning, and accounting for stores of material or material in use; (2) assigning locations and space to items, including verification of quality, identification, condition and value; (3) the physical handling of items, including binning, picking, stacking, and counting; (4) preparing or committing stocks for shipment; (5) inventorying stock; (6) replenishing depleted items; and (7) filling orders, and issuing tools, equipment, or materials to workers. Career objectives are identified with a variety of occupational groups and specializations, (as indicated in the Dictionary of Occupational Titles), such as Planning and Production Clerks, Shipping and Receiving Clerks, Stock and Inventory Clerks, Traffic, Rate, and Transportation Clerks, and Other Transporting, Storing, and Recording Occupations.

0600 Personnel, Training, and Related -- Planned learning experiences which include a combination of courses and practical experiences concerned with personnel administration of an organization and the facilitating functions of scheduling and conducting clerical work and management and operations of organizations. Career objectives are identified with a variety of occupational groups and specialization (as indicated in the Dictionary of Occupational Titles), such as Educational and Training Assistants, Interviewers and Tests Technicians, Personnel Assistants, and Other Personnel, Training, and Related Occupations.

0700 Stenographic, Secretarial, and Related -- Planned learning activities which include a combination of courses and practical experiences concerned with making, classifying, and filing records, including written communications. Career objectives are identified with a variety of occupational groups and specialization, (as indicated in the Dictionary of Occupational Titles), such as Executive Administrative Secretary, Secretaries, Stenographers, and other Stenographic, Secretarial, and Related Occupations.

0800 Supervisory and Administrative Management -- Learning activities and experiences concerned with a variety of responsibilities such as (1) studying policies, organizational structures, and administrative practices of such organizations as governmental units, industrial firms, and nonprofit groups; (2) reviewing periodic budgets submitted by operations personnel; (3) preparing reports summarizing findings and recommending changes in policy, organization, and administration to line management; (4) consolidating the budget estimates and preparing financial reports for consideration and action by upper echelons of management; and (5) supervising and coordinating activities, determining work procedures, and assigning duties.

0900 Typing and Related -- Planned learning activities which include a combination of courses and practical experiences concerned with recording data, supervising and administering typing staffs and typing, and managing offices. Career objectives are identified with a variety of occupational groups and specialization, (as indicated in the Dictionary of Occupational Titles), such as Clerk Typists, Key Punch and Coding Equipment Operators, Typists, and Other Typing and Related Occupations.

1000 Miscellaneous Office -- Planned learning experiences (not elsewhere classified) which include a combination of courses and practical experiences concerned with the facilitating functions, e.g., public contact such as registering hotel and motel guests, examining claims and records, and collecting and tracing accounts. Career objectives are identified with a variety of occupational groups and specialization, (as indicated in the Dictionary of Occupational Titles), such as Collectors, Hotel Clerks, Clerical Technicians, Credit Clerks, and other occupations and areas of specialization concerned with office occupations not listed or classifiable in the above categories, including emerging office occupations not classifiable in the above categories.

*OCCUPATIONAL SURVEYS; *EMPLOYMENT PROJECTIONS; *STATE SURVEYS; INDUSTRY; EMPLOYMENT PATTERNS
OKLAHOMA

A state-wide study of about 300 occupations was initiated to determine current and future manpower needs by industry division, major occupational group and selected occupation. A sample of 2,881 firms with 341,596 workers were selected for the study with over 70 percent responding. Data, when expanded to represent the universe, indicated that nonfarm wage and salary employment in the state should reach 758,700 by June 1969, an increase of 54,500 jobs, or 7.7 percent from the June 1967 level, and that such employment should reach 815,500 by 1972. The largest gains were forecast to occur in manufacturing followed by wholesale-retail trade and service. The greatest numerical gains for the major occupational groups should occur in the professional-technical managerial category. The largest single occupation surveyed was that of sales clerk followed by clerk general office, salesman and salesperson, nurse aide-orderly, teachers, waitress or waiter, secretary, cook, and clerk typist in rank order. The rank should remain about the same over the 5-year period. More detailed findings were to be released later in the year. (MM)

MANPOWER IN OKLAHOMA - SUMMARY
Preliminary Release

The Oklahoma State Employment Service, recognizing the need for future occupational requirements information, initiated in May 1967 in cooperation with the State Department of Vocational-Technical Education, a detailed study of almost 300 occupations. The primary objective of the project was to determine current and future manpower needs by industry division, major occupational group and selected occupations. Data were compiled for the metropolitan areas of Oklahoma City and Tulsa together with nine other geographical regions. This preliminary report summarizes the statewide analysis and follows a series of releases for the eleven regional studies.

A sample of 2,881 Oklahoma firms with 341,596 workers were selected for this study. Usable information was received from 2,021, or 70.1 percent, of these establishments accounting for 285,351 jobholders, some 83.5 percent of all the employment sample. The figures on Table V reveal response by industry division on both the number of firms and employment.

Data received from the responding firms, when expanded to represent the universe, indicated that nonfarm wage and salary employment in Oklahoma should reach 758,700 by June 1969, an increase of 54,500 jobs, or 7.7 percent from the June 1967 level. Moreover, the analysis revealed that such employment should climb by 111,300 jobs, or 15.8 percent, to reach 815,500 five years after the date of the study. According to participating employers, all industry divisions should experience growth over both the two- and five-year spans. The largest numerical and percentage gains are forecast to occur in manufacturing. Here, employment, which in 1966 surpassed the record World War II levels, will climb by 30,600 jobs from 114,700 in June 1967 to 145,300 five years hence. Significant expansion is also anticipated for several other divisions including wholesale-retail trade and service.

Substantial growth is forecast for several of the major occupational groups. For example, the greatest numerical gains should occur in the professional-technical-managerial category. This component is expected to add 25,556 workers through expansion alone in the next five years to retain almost one-fourth of Oklahoma's nonfarm wage and salary employment. Proportionately, large advances are anticipated in the bench work category, for machine trades occupations, in sales, processing and structural work. Gains in the first two mentioned of these categories could be traced directly to new job opportunities in Oklahoma's manufacturing concerns.

The largest single occupation surveyed was that of sales clerk, with 25,002 jobholders. Following that classification, ranked in order by size, were clerk general office; salesman and salesperson, commodities; nurse aide-orderly; teacher, elementary school; teacher, secondary school; waitress or waiter; secretary; cook, including institutional cook; and clerk typist. For the most part, forecast information from the surveyed employers indicated substantial growth for each of these occupations with the ranking to remain approximately the same over the next five years.

More detailed findings from this study will be released later in the year. The final publications will incorporate further information concerning employers needs by industry, replacement requirements, and match these against anticipated training output to get a picture of net requirements by occupation.

New Horizons in Industrial Arts. Bulletin no. 7.

American Industrial Arts Association, Washington, D.C.
MF AVAILABLE IN VT-ERIC SET.
American Industrial Arts Association, National Education Association, 1201 Sixteenth Street, N.W., Washington, D.C. 20036 ($.50).
Pub Date - Nov64 16p.; Speech given before 26th Annual Convention of American Industrial Arts Association, Washington, D.C., March 30, 1964.

*INDUSTRIAL ARTS; *EDUCATIONAL PHILOSOPHY; EDUCATIONAL PLANNING; *TECHNOLOGICAL ADVANCEMENT; *EDUCATIONAL OBJECTIVES; *TEACHER EDUCATION

Technological developments during and after World War II altered our civilization in many and diverse ways, and attitudes toward these developments crystalized in October of 1957 with the orbiting of Sputnik. Such international events often affect education specifically. Because national goals are molded thrugh education, an effective educational program depends greatly on our "preferred values" or upon our philosophy of life for these serve as a basis for educational programs. In addition to national goals, there are at least three building blocks from which an educational program is constructed: (1) new knowledge, (2) new findings in behavioral sciences and (3) the creative function of education. Against such a bakcground of change, industrial arts has arole in the expanding function of education for fulfilling our national mission. It should pursue the more sophisticated techniques which are basic to our industries. Moreover, pre-service and inservice teacher education in industrial arts should be remodeled and basic standards established; for of the several new horizons teacher education is primary. (EM)

1

Technological developments during and after World War II altered our civilization in many and diverse ways. Our attitude toward these developments crystallized in October of 1957 with the orbiting of Sputnik.

When an atomic bomb fell on Hiroshima on August 6, 1945, the explosion signalled the end of one epoch and announced the beginning of another, yet unformulated, way of life. For everyone the proximate result was the end of a world-wide conflict. Man looked hopefully toward restoring what was regarded as normalcy. Families could be reconstituted, physical damage would require much rebuilding, and the passage of time should help to mend the millions of broken hearts. The dead, of course, could only be mourned, but this is as it always had been. Certain aggressors had been brought to heel and, when the war was considered in its totality, good had triumphed over evil. A new international effort at peace, now called the United Nations, had an auspicious and optimistic start acknowledging the principle that, since wars begin in the minds of men, enduring peace must likewise originate in the minds and hearts of men.

But it soon became evident that the world refused to go back together in a manner which nostalgic memories regarded as normal. Of course there were certain features which should not be restored. Unemployment, for example, had plagued the civilized world after World War I, and there was renewed anxiety about post-war job opportunities. And, of course, we did not want new aggressor nations to arise. The U.N. should be the safeguard here, so we thought, as we fired a *coup de grace* into the shattered minds of the war criminals.

The pre-war world with all of its problems and conflicts was a relatively simple world. It was simple in terms of national goals and purposes. Hitler, for example, gave the world a major outline of what he planned to do, and his subsequent actions fell into place like parts in a jig-saw puzzle. Economics was relatively unsophisticated in terms of how goods and services were produced and exchanged. Technological developments seemed remarkable when placed against the backdrop of 1900, but the developments were straight-line extensions of known principles. A very large part of the world's population had no influence at all on events, not even those events which related to their own well being.

But new nations were forming even during the war and soon there were 49 additional nations, with a population of one billion people.

The United States came out of the war experiencing no physical damage within the continental boundaries. All of our European and Asiatic allies and enemies had suffered severe to heavy devastation, and some nations experienced a great human loss as well. There was a brief period when we felt quite secure, and our attention turned to the humanitarian tasks of helping friend and foe alike to get back onto their feet. Meanwhile, on the domestic scene, we debated whether Henry Wallace was sincere in advocating 60 million jobs; we made much ado over whether we should lay to rest the O. P. A.; and the Republican Party thought the way was really clear now for the election of Tom Dewey. In our naive manner we sought to restore a world of obvious simplicity—a world in which good men wear white hats and the bad men wear black hats as they do in western movies. But every time we managed to place a few old pieces of the world together other parts came unglued.

There were early indications that in the political world all was not well. Winston Churchill told us so in Fulton, Missouri, in 1946. Then the blockade of Berlin, resulting in the airlift, put the world on notice that two different ways of life were still in existence and in competition. The Korean nightmare followed in close order. On the technological front the Russians exploded their first atomic bomb in 1949—well ahead of our expectations. But we attributed this achievement to their obtaining our scientific knowledge through espionage. Then, in October, 1957, when the Russians placed an object in orbit and preempted the terminology of outer space with the word "sputnik," we stood appalled. At first we were assured we had not lost the race for outer space since we had never entered the race. One well-intentioned senator urged that we shoot down the orbiting sputniks but he never identified the missile we had available to do the job. However, as correctional lenses brought our myopia into better focus, we began to realize the world of reality differed considerably from the model we had created in our minds.

2

International events affect education, generally, and industrial arts education, specifically. Since national goals are molded through education, an effective educational program depends greatly upon our "preferred values" or upon our philosophy of life.

The world of international events of the sort just reviewed in a very abbreviated form might appear to be far removed from the educational scene and only very remotely connected with industrial arts education, if connected at all. But, actually, relationships do exist and they are important. This is especially so when it is realized that beneath the manifest and well-advertised national and international events there are fundamental changes in technology, and hence in the economy, and fundamental changes in the expectations of people.

National goals, national perspective, the competencies of the people are molded by or evolve *through education*. Any dictator knows this to be true and his first move is to gain control over all educational media. While in a democracy the ends or purposes are different from those of an authoritarian state, and so, too, are the educational means, the relationship between national goals and educational programs is even more important for a democracy than it is for an authoritarian state. Much of what we have achieved as a nation we have realized through the type and amount of educational opportunity we have provided. Conversely, in many of the places where we fall short of our national goals we can trace the root cause back to an educational shortage or to an improper education. The unwarranted occurrence of poverty and our neglect of basic research in many areas, are cases in point.

The education of a people should always be viewed within the cultural setting. Education can be a creative force, if the culture is aware of and accepts the premise of progress, and if the society can conceptualize the role which education can play in the forward progress of the people. Once the force of education is loosened to serve its creative role, a cyclical pattern is established whereby the greater accomplishments of educated people result in more demand for education of a higher order, and at the same time provide the capability for yielding more and better education.

An educational program is always postulated to be one which meets the needs

of the people, or at least as the dominant group within a society postulates these needs. Of course the diagnosis of needs might be invalid, and it frequently is; if so, however, the educational program is correspondingly inappropriate. There is no other way to account for the Latin American proclivity for educating lawyers in superabundance and for neglecting other forms and types of education.

An effective educational program depends very greatly upon a reasonably valid assessment of cultural needs and expectations and, of course, the analysis eventually gets back to preferred values or to a philosophy of life. The Russians, for example, are explicit with respect to their educational goals. From all indications their instructional content and their administrative procedures are consistent with these goals. However, no defensible evaluation of their educational procedures can be made unless purposes are brought into consideration. It should be apparent to all that Russian education has paid off well, but the pay-off has been in terms of Russian goals and objectives. And to their credit it should be said that in the darkest days of their transition—in the early 1930's—they invested heavily in education. During the bleakest moments of World War II they did their best to maintain an educational program. Their success in selected scientific fields is testimony to their dedication to education as an instrument of national policy.

3

In addition to national goals, there are at least three building blocks from which an educational program is constructed: (1) new knowledge. (2) new findings in the behavioral sciences, and (3) the creative function of education.

National goals and national purposes do not represent all of the building blocks from which an educational program is constructed. There are at least three additional considerations. The first is the development of new knowledge. There is documentation[1] to the effect that since World War II new scientific knowledge has doubled in approximately an eight-year interval. Almost entirely new areas of mathematics have emerged. There are new fields of applied mathematics and science such as the computer science field. There are developments in the social sciences, the behavioral sciences, and in the humanities also. Any educational program which develops or operates without an awareness of emerging knowledge is presently ineffective or is destined to become ineffective. As a complement to the first development, we can return to new findings in the behavioral sciences. Over the centuries philosophers, principally, have been concerned with learning and with approaches to instruction. Now the behavioral scientists are coming along with substantial explanations and refinements of learning theory and of human capabilities. A recent issue of the *Review of Educational Research* reports that of the "nearly 60 dimensions of the mind discovered to date, more than 50 should now be described as nonintelligence intellectual dimensions." [2] The ferreting out and development of these talents

With this continuing growth of 10 percent more each year and a doubling in the annual growth every eight years it is obvious that more has been published in the past ten years in science, than was published in science in all preceding time. Another way of indicating this compounding growth effect in science is the oft quoted phrase that 90 percent of all scientists who have ever existed are alive today.

[2] Calvin W. Taylor and John L. Holland. "Development and Application of Tests of Creativity," *Review of Educational Research*, 32:1::93; p. 93. Citing C. W. Taylor (editor). *The Second* (1957) *University of Utah Research Conference on the Identification of Creative Scientific Talent.*

requires an educational setting as broad or as comprehensive as the range of human talents to be encouraged.

Third, there is the creative function of education previously mentioned. It is of interest to note that through recent refinements in econometrics it is possible to get at least an approximate measure of the contribution of education to the general economy. A recent study of the sources of economic growth in the United States attributes 42 per cent of the increase in output per worker in recent decades to education, and 36 per cent to advances in knowledge; and for the decades 1960-80, the share of education is pojected at 40 per cent while that of advances in knowledge rises to 46 per cent of the increase in output per worker.[3]

In a similar vein, Barbara Ward reports that "Recent studies suggest that between sixty and fifty per cent of the gains in production made in the West in the last half-century spring from better trained minds, from more research, and more systematic use of the economy's brain-power . . ." [4]

Walter Lippmann, in a news column, discussed the recently declared war on poverty. Lippmann commented that: "A generation ago it would have been taken for granted that a war on poverty meant taking the money from the 'haves' and turning it over to the havenots.' For until recently it was always assumed that there was only so much pie and the social question was how to divide it." [5]

Continuing, Lippmann elaborates: "But in this generation, one might say in the past thirty years, a revolutionary idea has taken hold on the advanced countries of the world. The size of the pie to be divided can be increased by invention, organization, capital investment, and fiscal policy, and then a whole society, not just one part of it, will grow richer." [6]

Turning his attention specifically to the reason for poverty in the United States, Lippmann reports: "The modern studies of poverty have demonstrated—I think beyond dispute—that the greatest of all causes of poverty is a lack of education . . ." [7]

Of course, the creative contribution of education always works through people —more competent people—even though the manifestations of the improvements take the form of better production techniques, wonder drugs, an extended life span, better music, more responsible government, and better schools. In addition, appropriate measures of progress should include the direct influence on the individual person such as his feeling of accomplishment, of self-respect, of personal adequacy.

4

With this background of change, consider three major areas or highways along which industrial arts may flow. The first is the role of industrial arts as a part of the expanding function of education for fulfilling our national mission.

In light of the accelerated man-made developments which have come to affect the subject matter we teach—which affect the understandings we have of the learner and of the learning process and which in turn change man's relationships with man throughout the world—we should not expect industrial arts education to exert much influence on the future unless we can envision the unique approaches and unique contributions we can make to the education of the present and future generations. The old world—the pre-war world—has passed. Do we want to become relics in the museum, or do we want to have some part in shaping the world of the future?

No single paper can identify and elaborate upon the educational needs of the future, or cite all of the highways along which industrial arts education should travel. The best service I can render lies in pointing out a few broad avenues which will, in turn, suggest a route or direction for those of you who work in industrial arts laboratories day-by-day.

I shall confine my efforts to three major areas:

1. Industrial arts as a part of the expanding function of education for fulfilling our national mission.
2. The pursuit of more sophisticated techniques basic to our industries.
3. The essential remodeling of teacher education.

Perhaps the simple enumeration of these major headings would be adequate for you to draw your own conclusions. But, for the sake of getting the consideration underway, I shall elaborate by making reference to a few of the more obvious implications.

First, let us look at education and the fulfillment of our national mission which is, as I see it, the opportunity for each person to become the best person he can possibly become. The basic component of the free-enterprise system is the development of unique abilities coupled with the opportunity to employ or use these abilities.

Recently much has been said by our national leaders about the elimination of poverty. For the first time in the long history of the world it is possible to eliminate poverty in this one great nation. It is possible also to raise the general standard of living in 12 to 15 years once again as much as it was improved in the 25 year span between 1920 and 1945. The syndrome of poverty and lack of education have already been cited in the Walter Lippmann reference.

The most obvious need in the immediate future in the United States is to provide *more* education to *more* people—children, youth, and adults. As a statement of policy it sounds very simple indeed. But if we are to be successful in keeping more children and adolescents in school longer—and do not choose simply to have schools become socialized babysitting—we must develop a more comprehensive program beginning with the elementary school. If there are 50 or more non-intelligence intellectual dimensions, certainly many of these intellectual dimensions relate to competencies which society desperately needs. The unwarranted emphasis on verbal competence in our schools must be shifted into a better balance.

It is of passing interest to note that one city recently made national headlines by rounding up high school dropouts during the summer and by persuading these dropouts to return to school. The more important component of an appropriate educational program never reached the threshold of consideration and so the students returned to substantially the same educational menu that they had already found unappetizing.

But there is considerably more to a broadened curriculum than the retention of dropouts, important as is retention, socially and economically. *Quality* or *excellence* is another dimension. At the simplest level, has it occurred to the critics who say "Johnny can't read" to wonder whether just more of the same reading instruction or whether some technique, such as phonics, is going to make the difference? If the problem were this simple, it would have been resolved long ago. Reading is the sharing of experience, and the reader must take something to the sharing process. Motivation is an important second side of the same coin. The dry pages of the reader, no matter how well illustrated in multicolored pictures, have reached saturation in the number of students who will learn to read and in the level of attainment the pupils will reach. If we really want to get more children and youth to obtain greater amounts of formal education and to have those who persist reach higher levels of achievement, we must turn to a wider range of educational experiences. Certainly the expressional arts will appear in the expanded program and industrial arts will be prominent among them.

Now there is no grand scheme of education already in existence to provide larger amounts of education of greater excellence. The essential education remains to be developed. And whether industrial arts education is in or out of this new forward march will be determined by our direct participation at the national level, at the state level, and at the local level.

We shall need to approach the problem with new ideas and with new instructional materials. This is essentially a creative area, quite as much for industrial arts as it has been for mathematics and the physical sciences. One new direction for industrial arts must certainly be to travel the course of expanding educational opportunity for American children and youth.

5

The techniques of automated factories, space ships, etc., have evolved recently, while the approaches of industrial arts have grown from a completely different and older order. We need a new focus on the relationship of knowledge and skill . . . and the level of technology we select for teaching.

My second concern relates to techniques, an essential component of the industrial arts program. I think it is clear to all by now that automated factories, space ships, ray guns, digital computers, and heart pacers have evolved from knowledge and techniques which are recent in their development. In contrast, nearly all industrial arts instructional materials and approaches have grown out of a completely different and older order. The quick review of any text in industrial arts, chosen at random, will serve as documentation.

Knowledge and performance are now closely related in the sciences and there is practically no skill of significance which is unrelated to a substantial body of knowledge. This fact should give us pause in industrial arts. For lo these many years, we have been contented with dragging in a bit of related information, either essential to learning a skill or to give dignity to the skill once it has been learned.

But, in addition to this relationship between knowledge and skill, there should be even greater concern for the level of the technology we select for teaching.

It is certainly reasonable now to assume that we are not limited to the years associated with the junior high school or with selected years within the junior high school, such as grades 7 and 8. As an aside, let me comment that it is an unfortunate historical accident for industrial arts education that it has been so closely associated with the junior high school movement. The influence has been so pervasive that most *high school* industrial arts programs have tended to be just more difficult junior high school offerings, and *elementary industrial* arts programs have been simplified junior high school offerings.

We can now expect to have students in greater percentages throughout the high school period and, with the rapid rise of community colleges, a significant number of students can benefit from continuing their industrial arts instruction at this level as well, provided we develop suitable programs. This forecast as-

sumes a much higher level of instruction than we now offer. No part of the industrial arts program can escape this trend toward greater sophistication, if we are to move at all. For example, the conventional drafting course cannot be further improved by insisting upon squarer corners, neater lettering, better line delineation, and sharper arrow heads. The new drafting must become what the preface of drafting books have said for years—namely, a means of formulating and communicating ideas. The emphasis must move to space relationships, to principles of mechanics, electricity, and materials, and to qualities of design. Practically everything designed must *do* something and the criterion for the design is compatibility between expectation and performance. Other examples, some of them more dramatic, could be chosen to identify the new high-level ground we must strive to reach. For the moment, however, the vision is much more important than the next steps.

6

Any forward thrust in industrial arts depends greatly upon the quality of teacher education. Laboratories in our teacher-education institutions continue to be manipulative-skill oriented. The time is overdue for the profession to establish basic standards in teacher education.

By this time I think we shall acknowledge generally that any forward thrust in industrial arts education depends greatly upon the quality of teacher education. This generalization should not come as a shock any more than to say that medical schools of today determine the medical practice of tomorrow. We cannot wait for an entirely new crop of industrial arts teachers or for a new generation of industrial arts teacher educators. Strenuous in-service effort must be exerted just as has been true for physics and mathematics. But there is no sensible reason for compounding the inertia by turning out more of the same teachers as were graduated in the pre-war years.

Shops and laboratories in our teacher-education institutions continue to be manipulative-skill oriented. And they will remain so (1) until the students meet much more strenuous math and science requirements and (2) until the teacher educators build up their own technical backgrounds in very substantial ways. If we are to make the minimal essential changes in industrial arts teacher education, these minimal changes will be extensive. I make this comment to leave no doubt about the extent of change I have in mind. Many of our teacher-education programs are in serious difficulty and others will join in the dilemma unless constructive changes are made in their curriculums in the near future.

The time is already overdue for the profession to establish a few basic standards in industrial arts teacher education. A poorly prepared teacher is a liability to the students he, in turn, tries to teach, to the college he represents, and to the entire profession. His diploma is a lifetime certificate to do a poor job of teaching, and to ruin the potentials of thousands of students. There is no organized body other than this professional group to look out for the public welfare in industrial arts education. It is the business of the profession to state what shall be the minimum competencies of the industrial arts teacher. Siwash State Col-

lege should no longer be permitted to label one of its graduates an industrial arts teacher if that person lacks college-level courses in physics, math, and chemistry, or if that person lacks laboratory experiences in the phenomena of modern industrial techniques.

No good college will be affected adversely by being asked to provide a much more rigorous industrial arts curriculum. A college that is led to close out its industrial arts program through an inability to provide what is needed, by its very act of closing will be adding to educational excellence. A poor or mediocre college program is an indefensible professional liability.

Of the several new directions industrial arts should travel, the teacher education route is primary and it will likely be the most difficult to traverse. Traditions die hardest in higher education.

Cliches die hard in education. If we fear we are getting too far out onto the educational frontier, let us realize that our students of today will reach their "zenith" in the year 2002.

Cliches also die hard in education. There are those who prefer the "tried-and-true-education" without ever having put the education to the test; there are those who take the "middle-of-the-road" without asking where the road leads; there are those who cling to the "basic skills" without ever questioning how long these skills have been extinct. If, at any time we get the impression that we might get too far out onto the educational frontier, we should remind ourselves that, in education, we are always at a serious time disadvantage. Simply stated, the children we now have entering the elementary schools will not make their initial contributions to society until 1980, and most of them will not reach their zenith until the year 2002. Does anyone here think that we, today, in 1964, can get far enough ahead in our thinking to anticipate the lives of these children as they take over our responsibilities in 2002?

The historians of the future will say whether we used our knowledge and resources to perpetuate in vain a world which has ceased to exist, or whether we used our imagination and wisdom to build boys and girls who, in turn, created a better world. Each one of you has a part in this important decision.

*DISTRIBUTIVE EDUCATION; *DISTRIBUTIVE EDUCATION TEACHERS; *TEACHER EDUCATION; *POST SECONDARY EDUCATION; PROGRAM DEVELOPMENT; *PROGRAM ATTITUDES; TEACHER RESPONSE; TEACHER ATTITUDES; *TEACHER EXPERIENCE; PROGRAM IMPROVEMENT

A person with a background in post high school distributive education programs was interviewed to ascertain his opinion and feelings concerning his experiences in the organization, operation, and development of the programs. Specific conclusions are not drawn, but the purpose of the study was to present information from which the reader might identify implications and issues that could be used in improving teacher education programs in distributive education. Some of the 26 questions asked in the interview were: (1) Did you have any specific professional preparation to be a post high school coordinator, (2) How did you feel about working with post high school students, (3) What was the nature of the post high school program that you operated in your first year at that school, (4) Did you know what you were going to teach, (5) Describe one or two of the teaching methods that seemed to work best for you at the time, (6) What did you do to make the program known, (7) How would you summarize your early experience as a post high school teacher-coordinator, and (8) Do you feel that a teacher education program which is preparing teacher-coordinators for high school positions can give sufficient background to qualify a person as a post high school coordinator instructor. FOREWORD

The Council for Distributive Teacher Education was organized in 1961. Membership in the organization consists of teacher educators and other distributive education personnel with an interest in advancing distributive teacher education. The primary interests of the Council are research and publication.

This study is concerned with the organization, operation, and development of the post high school program in distributive education. The interview plan of presentation is a pleasant departure from the usual style of documentation.

The author has deliberately avoided drawing specific conclusions concerning the solution of the problems involved. Rather, it is hoped that teacher educators will study the issues involved in an effort to improve their own programs. The study is especially timely in this period of rapid expansion of programs at the post high school level.

The Historical Development of a Post High School Distributive Education Program with Implications for Teacher Education was prepared by Wayne G. Little, Chairman, Division of Business, University of Minnesota Technical Institute. It was published through the courtesy of the Division of Business, University of Minnesota Technical Institute, Crookston, Minnesota. Requests for copies should be addressed to Mr. Little.

TABLE OF CONTENTS

Introduction 1

Interview. 3

Question No:

1. How long have you been a post high school coordinator? 3
2. When did you first become interested in teaching at the post high school level? 3
3. Did you have any specific professional preparation to be a post high school coordinator? 3
4. Knowing your background, how did you feel about being involved in a post high school program with no previous experience? 4
5. How did you feel about working with post high school students? 4
6. In What kind of school did you begin your teacher-coordination experience? 5
7. Was the post high school distributive education program established before you began your assignment? 6
8. Did the school administration understand the operation of a distributive education program at the post high school level? 6
9. What was the nature of the post high school program that you operated in your first year at that school? 7
10. Did you know what you were going to teach? 7
11. Before I ask you how you developed the curriculum in terms of the courses that were taught, will you give us some idea of what you did about getting students for the post high school program? 8
12. Did you seek help from other faculty members in solving some of the problems that you were facing? 9
13. What was your teaching schedule during that first year? 9

Question No:

14. After determining the kind of students you were going to have, what basis did you use for selecting the courses that were taught? 10
15. Will you describe one or two of the teaching methods that seemed to work best for you at the time? 11
16. What were the capabilities of the students in your classes? 13
17. What was your relationship with the students outside of the classes? 14
18. What did you do to make the post high school distributive education program known? 15
19. Will you recall some of the things that you experienced during your first coordination calls? 17
20. What kind of facilities did you have for the post high school program? 19
21. Did you have club activities for your students? . . 19
22. You have mentioned that you were involved in the adult education program. Will you briefly explain your activities in this area? 20
23. Would you comment on the second post high school program that you started? 23
24. How would you summarize your early experiences as a post high school teacher-coordinator? 24
25. Do you feel that a teacher education program which is preparing teacher coordinators for high school positions can give sufficient background to qualify a person as a post high school coordinator instructor? 25
26. If you had it to do all over again, would you choose post high school distributive education as your field? 26

General Implications for Teacher Education 27

THE HISTORICAL DEVELOPMENT OF A POST HIGH SCHOOL DISTRIBUTIVE EDUCATION PROGRAM WITH IMPLICATIONS FOR TEACHER EDUCATION

INTRODUCTION

". . .I disagree. Our teacher education program does not need revision in order to meet the requirements of those few students who have decided to teach at the post high school level. . ."

". . .I'm not so sure. I've just returned from a distributive education conference and one of the presentations dealt specifically with problems faced by post high school coordinators. . ."

". . .Is there a problem? One of my recent graduates developed a very successful high school distributive education program before moving into post high school distributive education this last year He is having as much success with his post high school program and we do not include post high and adult distributive education instruction in our teacher education curriculum. . ."

". . .That's interesting because I have a young man who began his teaching career in a post high school program four years ago and this fall he accepted a position in a larger city as a high school distributive education coordinator. He is doing very well. . ."

". . .If some slight difference does exist, I'm sure that my staff can develop a complete and current bibliography to meet the challenge of these differences without having to make major changes in our course content. . ."

Disconnected and contrived statement - Yes! Comments such as the above may or may not be unusual. Perhaps there is no real case to be made at this time for the development of post high school and adult distributive education teacher preparation programs or the inclusion of such instruction in existing programs. But if there is no immediate concern, there is seemingly a great deal of interest.

In an attempt to further this interest and possible concern, the author has made use of the informal interview technique as a means of relating the combined experiences of several post high school co-ordinators as voiced through one individual's responses. The reporting technique is contrived, but the questions and answers are not.

In the summary, liberty is taken to identify several broad implications for teacher education programs. Hopefully, however, it will be the desire of the reader to draw meaningful implications for his own teacher education program, based on an individualized interpretation of the interview.

INTERVIEW

QUESTION NO. 1: How long have you been a post high school coordinator?

Answer: I have been in distributive education for ten years. The first six years of my experience dealt specifically with post high school coordination and instruction. During the last four years I have been more involved in the administrative aspects of distributive education.

QUESTION NO. 2: When did you first become interested in teaching at the post high school level?

Answer: I had given it very little thought while I was going through the undergraduate program. I was primarily interested in being certified as a distributive education coordinator and then getting a good job somewhere. Real interest first developed when I read a placement notice announcing a position for an instructor-coordinator in a post high school institution. Although, upon graduation, I had intended to seek a high school position, I decided to apply. It was through the interview with the post high school representative that I really became interested in distributive education at the post high school level. As a result, I decided to accept this position when it was offered to me. After accepting the position, I felt very uncomfortable about the whole thing, because it seemed that I might be getting into something that I knew very little about and that I might not be capable of handling such a program.

QUESTION NO. 3: Did you have any specific professional preparation to be a post high school coordinator?

Answer: Instruction in the teacher-education program was geared primarily to meet the needs of distributive education at the high school level. This made sense at the time because the high school program was where the bulk of distributive education instruction was taking place. Some of the materials introduced in my professional preparation touched on post high school instruction and reviewed various adult education processes. I would not say there was any specific training for post high school instruction and coordination.

QUESTION NO. 4: Knowing your background, how did you feel about being involved in a post high school program with no previous experience?

Answer: Probably the best way to describe my feelings would be to use the word insecure. I wanted to do a good job and really did not know whether I had what it would take to operate a successful program. It would seem natural to be concerned aboutthat first teaching experience, but there may have been more concern on my part because I was not familiar enough with the operation of a post high school program to have a home base from which to work.

Question No. 5: How did you feel about working with post high school students?

Answer: In the beginning I did not think about this. Later as the fall term neared, it struck me that I would be working with an entirely different group of people than I had anticipated and at a different level. Fortunately during my college career I had an opportunity to work both with college students in a teaching capacity

and with high school students in the same capacity. On reflecting back this may have been a major influence in my final decision to take the position that was offered to me. As to my reaction to working with post high school students, it seemed to me then that post high school students would be easier to work with because of the fact that many of them in addition to being more mature would probably have had prior experience in the field of distribution. Of course, this is what I thought at that time, because I did not know how much and what variety of experiences these post high school students would have. I was concerned that I might have people in my class who would probably know a lot more about many of the subject areas in marketing and merchandising than I would. I wondered what I would do if someone pinned me down on a particular topic, and I could not give them a satisfactory answer. To digress for a minute, I might say that in later years with an expanding staff, I found that this concern was one of the greatest problems that I ran into when hiring people for post high school positions. Basically it seemed to me that many prospective distributive education personnel were afraid of getting involved in post high school education for the very same reason that I had, that is the concern with not being able to come up to the level that post high school students would expect and feeling that their background and knowledge would not be sufficient to do a good job.

QUESTION NO. 6: In what kind of school did you begin your teacher-coordination experience?

Answer: This first position was with a technical and adult education school. As I mentioned before, my interest came out of an

interview for an announced position which was at a post high school level. Incidently this position also involved responsibilities in the adult evening school program. The institutional emphasis, of course, was on post high school education during the day, supplemented by an extensive evening school program which offered a variety of courses in the various occupational fields. The whole program was geared to the person who was out of high school.

QUESTION NO. 7: Was the post high school distributive education program established before you began your assignment?

Answer: No, it was not. Distributive education in this particular school had been conducted on a limited basis as part of the evening school program. Before I accepted the position, some indication was given during the interview that ground work had been conducted to prepare the community for the establishment of this program. Post high school distributive education in this school, however, was brand new and it was up to me to make it a success.

QUESTION NO. 8: Did the school administration understand the operation of a distributive education program at the post high school level?

Answer: That is a rather difficult question to answer. I can honestly say that the administration probably knew a great deal about post high school programs and adult education programs in general. They were not, however, familiar with a distributive education program, nor were they aware of the problems that would be involved in a program of this kind. Since the administration had experienced limited contact

with distributive education at the post high school level, it turned into a first time experience for everyone concerned.

QUESTION NO. 9: What was the nature of the post high school program that you operated in your first year at that school?

Answer: Because of this lack of experience and with no guide lines to follow, we agreed, without actually saying so, that the duplication of a high school program plan at the post high school level seemed to be the most logical approach at least for the first year. As I look back on it now, I feel that in many ways this was a mistake, but after all, we are supposed to profit from our mistakes. At the time I had no opportunity to study the curriculums of schools outside of the state in which I was located. Basically our first year's operation was a takeoff on a high school program, that is, one in which the students would attend school in the morning for four class hours and then be employed in the afternoon. This seemed in the beginning to make the most sense to me because after all this was what I was most familiar with. With no point of reference, I felt that I had little choice but to do this, because I do not believe there was another distributive education program at the post high school level at that time anywhere in the state. My first year's teaching experience really amounted to pioneering, and I think you can realize that it involved a great deal of guess work.

QUESTION NO. 10: Did you know what you were going to teach?

Answer: Again, you must remember that I felt I did not have a good frame of reference from which to make specific decisions at that

time. I had very little insight into what subjects I should offer. This seemed to evolve after student contacts were made and I had an idea of what their backgrounds were. I know that this does not sound like a very good approach to the beginning of a new program, but as I have said before, we had to start somewhere, and I guess I started at the beginning.

QUESTION NO. 11: Before I ask you how your curriculum evolved, will you give us some idea of what you did about getting students for the post high school program?

Answer: This experience was a real introduction to the post high school program. When I arrived to take this first position, I found that we had no students. Room schedules, class times, and that kind of thing, had been taken care of. Nothing in a direct way had been done to recruit students for the classes. As a result, a week after the school year had started, I found myself still recruiting students for the program. I think you can understand that I had some rather hectic times and spent quite a few sleepless nights trying to determine how I could go about recruiting students with the school year already under way. I doubt that I was very original in what I did. I went into the business community from door to door in the downtown area soliciting potential students from the places of business for this program. To convince an employer that he should give a full-time employee a half day off to attend school was no easy task. I do not know what would have happened if I had not been able to recruit students for the program. The experience of going from one place to another

without knowing anyone and without knowing the kind of approach to use was cause for a great many disappointments. To sit down with the management of a particular firm and try to explain to them what this program was all about was most difficult, because I was not really sure myself. In addition, I had nothing concrete to point to that would show these employers that this program would be of direct benefit to them and their employees. If I had been promoting a high school program, the task would have been much easier for me, since I was familiar with the direct benefits of a high school program to the student, to the community, to the businessman and to the school. However, I did not know if the same benefits applied in a post high school situation and this was cause for great consternation on my part.

QUESTION NO. 12: Did you seek help from other faculty members in solving some of the problems that you were facing?

Answer: I found the faculty in this school to be very helpful. In fact, in some ways if it had not been for the assistance that I received from them, I am sure that the day program would not have gotten off the ground at all. Various faculty members gave suggestions on whom to see, when to see them, and what kind of philosophy to relate to the employers that I contacted. They also gave me a start on developing a list of the benefits of participating in this kind of program as they affected both the employer and the employee. About fifteen out of the large number of employers that I visited seemed to feel that this program had something to offer to them. As a result, I started my first teaching experience at the post high school level with fifteen students.

QUESTION NO. 13: What was your teaching schedule during that first year?

Answer: In the morning I taught four different classes. There were four classes the first semester and four different classes during the second semester. In the afternoon the students would return to their jobs and I would go out and coordinate the in-school instruction with the experiences that they were having on the job. You realize, of course, that my schedule as we are discussing it here involved only the post high school program during the day. Perhaps we will discuss my responsibility in the adult evening program later.

QUESTION NO. 14: After determining the kind of students you were going to have, what basis did you use for selecting the courses that you taught?

Answer: The basis that I used for selecting the courses that I taught in the final analysis was my own background of experience. In other words, I selected courses that I had either taken myself or I had been oriented to in my undergraduate program. With the students' needs utmost in my mind, I selected for that first semester, Marketing Principles, Salesmanship, Business Math, and a course that I called General Psychology. In the second half of the year, I taught Advertising, Display, Sales Management, and another course called American Institutions. I never felt that I did a good job of teaching that year, because there was just too much to cover and I did not have the background to feel competent in all those subjects. I ran into tremendous problems selecting textbooks and various materials to use.

Most of the texts that were available at that time were either too simple or too difficult, too long, or too short. I hope that I am not creating the impression that I was tied to a textbook, for I found that the textbook worked only as an aid in the classroom. But I did need a frame of reference and I found that where I used a textbook that it did save me a great deal of time in terms of class organization and presentation. In some courses I did not use a text at all, because of the particular objectives that I had drawn up for the class. I initially referred to texts that I had used as an undergraduate student and drew heavily from my own personal experience in presenting material that I felt was pertinent to the needs of the students. Salesmanship, for example, was a course in which I used no textbook at all. I felt that most of the books that were available were written for high school programs and I was not sure that this would fit the bill for that group of post high school students. I chose to develop materials of my own and borrowed from the experiences of an instructor who had taught a salesmanship course for adults in the evening school program. In each course I started out by developing objectives which seemed to be in keeping with the goals that I thought the students had. I found, however, that during the course of the first semester the objectives that I had established changed many times. As you can well imagine, teaching four different subjects a day as well as being involved two or three nights a week in an evening school program, made for rather a busy schedule. In fact as I think back on it now, I feel sorry for those students who had to listen to me four hours a day, five days a week, for a whole year.

QUESTION NO. 15: Will you describe one or two of the teaching methods that seemed to work best for you at the time?

Answer: I was fortunate because my undergraduate teacher education program placed great emphasis on teaching methods. I attempted to make use of a number of these teaching methods with my post high school students, but soon found, however, that in some instances I received different student reactions than when I had used those same methods in my student teaching experience with high school students. Let me give you a specific example of one method. Whenever presenting new material there was a tendency on my part to use the lecture approach. This is one of the methods that I used when I worked with high school students, and of course, I allowed them to participate as a way of building interest. It seemed to me that this would also be a basic method of presenting material to the post high school students. I discovered, however, that by the end of the first week, that the lecture method and participation by the students presented some outcomes that were completely different than what I expected. Because of the kinds of students that I had, with the variety of background experiences they represented, I found that when presenting something in the way of a basic principle or concept in marketing, many of the students in the class had already experienced that concept or principle in a practical way, and what I had intended to be a brief discussion on a particular subject often took up the whole period. This meant that in some cases I had to draw more heavily on my own occupational experience in conducting the class

than what I had done in the way of research to form the content of the notes before me. At times, because I had quite an outgoing group, I had to limit their participation. This "method" of conducting the class ended up as a combination of conference leading, lecture, and group discussion at best, or maybe a method with no specific title at all. Whatever the method was, it seemed to work best for me at the time. Obviously this was not the only way that I conducted classes. It was, however, the machinery out of which other methods evolved. Because of the fact that I had these students four hours a day, the pressure was on me to provide a variety of teaching techniques in the class. I tried a number of things, not really knowing what to expect--role playing, panel discussion, outside speakers, field trips, audio visuals and so-on. In the final analysis I found that when I could relate the classroom instruction to the past occupational experience that the students already had, it seemed easier to accomplish the goals that I had set. One other method that I found extremely successful with these post high school students was the use of case problems. These students were extremely interested in case problems particularly when they related to the experiences of the class and also when a student could take the results of a case problem discussion and make immediate application of that outcome to his work. It is difficult to describe specifically as you have asked, methods that can be used with post high school students successfully. I do not believe that either high school teaching methods or collegiate teaching methods separated or in combination are the best way to reach the student at

the post high school level. It would seem that teaching methods for this group need to be more readily identified and that much more research should be directed to this area in order to meet the needs of the expanded post high school program as we now see it.

QUESTION NO. 16: What were the capabilities of the students in your classes?

Answer: If by capabilities you mean their experience , their ability to learn and to apply, I had as great a range there as I did in terms of age and interest. There were people in my class who had a great deal of management experience and there were people who had no business experience. This then was a group in which the students had an opportunity to learn from one another as well as from the material that was presented in class.

QUESTION NO. 17: What was your relationship with the students outside of the classes?

Answer: My relationship with the students involved much more than teaching the classes and maintaining rapport with them and their employers. These students had problems that were immediate and this made me realize that what I was doing was directly affecting their futures in terms of their career objectives. They expected a great deal out of their classes and they were not there just to put in time. There was no law saying that they had to be in school. These students had many personal problems, which they brought to me. There were always questions about whether or not they were doing the right thing in going to school. They sought continual encouragement which necessitated my being a constant salesman and disciple for the program.

I think that as a person I also benefited a great deal from the experience of that first year. These were people who were wage earners and who were not just thinking about possible careers in this field. They really wanted to do something to improve their situation. On many occasions when I presented material in a class I came away completely dissatisfied with what I had done. I would ask myself, "How are these people going to use what I presented to help them in the career that they have chosen?". Often I could not answer this question. I think that for the new teacher coordinator in a post high school situation, there is a great deal of pressure. You have to deliver everyday and it is not always possible to get by. These students picked up things that I would present in class and would try them out. They would let me know if it did not work. They would want to know why it did not work, and was there something that I could do to help them in terms of a new approach, new techniques, or with a particular problem that they had on the job. I had one student in my class who was in charge of display for a large department store. During the second half of the year when I taught display and showcard lettering, this person was a tremendous asset in the class and I learned not to be afraid of the experience that the students had, but to use it to the advantage of the whole group.

QUESTION NO. 18: What did you do to make the post high school distributive education program known?

Answer: This was an area in which I also had very little background knowledge. One of the first things that I did was to talk individually to each businessman in the downtown area about the program

and its benefits to them. The idea obviously was not original but it seemed like the logical first step. However, to make a cold call on an individual whom you have never met before and to attempt in a short period of time to explain a new program gave me the feeling that I could have used some additional training in the use of professional sales techniques. I did several other things too, some that worked and some that did not work. I was called upon to develop brochures for the distributive education program. I had taken a course in advertising when I was an undergraduate student, but unfortunately this class did not involve practical applications. I also wrote a number of newspaper articles. As with the brochure, my experience in writing was also limited. Eventually I began to get across the message that I wanted to in the shortest number of words necessary. One of the things that also bothered me in the beginning was speaking before many people. I had to speak to groups of people who represented management and executive organizations and in doing so, met them on their own terms and tried to show as best as I could how the program would benefit them from the profit standpoint. An excellent way to learn what to say in these situations, I felt, was by actually doing it. A great deal was revealed to me through this experience. Probably the willingness to take on a number of speaking engagements was one of the big factors in what success we had in getting students the second year. The brochures and the newspaper articles paid dividends later. I found that during those promotional experiences many people, educators in particular, did not have a clear understanding of what this program was all about. They were familiar with distributive education at the high school level,

but were not sure what we were trying to accomplish with a new program at the post high school level. Because of this situation, I went out of my way to make contacts with high school principals and superintendents where possible, and high school counselors in particular. In addition to meeting with these people, I talked before PTA groups, various service club organizations and several library associations who had direct contact with potential students. If someone needed a speaker, I volunteered. In the beginning the school volunteered my services for this, and as time went along, I found it was just a little easier to talk about the program and I was able to answer most of the questions that were asked. In the final analysis the best salesman for the program in terms of recruiting new students were the students that I already had. For example, when I participated in a career day program, I came upon the idea of letting students in my class conduct these career day sessions. I would take the first five minutes and then we would break up into small groups. In each of these small groups one of the students would sit down and informally visit with the high school students explaining the program to them. I found that this was a very effective way of recruiting for the coming year. This approach, as with a few others that Have been mentioned, was a matter of stumbling into it rather than referring to any particular source for assistance. I suspect now that if there had been other post high school programs in the area who were involved in distributive education that I would have contacted them and asked them for suggestions on what to do. At that time there did not seem to be anyone who could serve as a source and so I went out and made the mistakes myself. In addition I found that

I had to do a constant selling job right in the school. Even though all of the staff were involved in post high school education, they were not completely familiar with distributive education, particularly at the post high school level. They asked questions and apparently most of the questions were answered successfully, because as I had said, I gained a great deal of support from the staff as time passed. In the final analysis, I think the individual contact was probably the most effective approach I used. In addition, however, I do feel that what my students did for the program was the best promotional technique that we had available.

QUESTION NO. 19: Will you recall some of the things that you experienced during your first coordination calls?

Answer: In the beginning I expected the same kind of experiences that I had been exposed to during my student teaching, that is sitting down with the employer, talking about student progress, seeking evaluations, and working out mutual problems that we might have had. As time passed, I found that some of the employers began to ask questions which related to problems that they themselves had in their particular business. This, of course, was in some ways gratifying, because apparently they felt that I could help them. I also found that coordination became a vehicle by which not only the post high school program was developed, but also the adult evening school program. Many employers and employees in participating firms later enrolled in classes that were made available by the evening school that year. Let me give you one instance of that. As I recall, one of the students that I had inthe post high school program was assistant dairy department manager in one of the local large

chain stores. On various calls to his training station I had several opportunities to visit with the manager of the establishment. During one of these coordination calls he indicated that he was concerned about a source of supply of experienced cashiers for the store. Through the school we made arrangements to provide an educational program which trained people to become cashiers. Out of this contact a desire was expressed to expose the department heads in all of the food stores in the community to new merchandising techniques that were being developed. We established a seminar program in which experts were brought in and they conducted the program in a very successful manner. Much publicity resulted which also reflected on the development of the post high school program. I suspect that in some ways this coordination experience was different from what I might have experienced had I been involved in a high school program.

QUESTION NO. 20: What kind of facilities did you have for the post high school program?

Answer: There were no specific facilities set up for the distributive education program the first year. I used a standard classroom with movable tables and chairs. At the end of the first year, I made recommendations for the kind of facility that was needed to carry on in a more effective way the distributive education program that I had started during the previous school year. I determined the facility needs on the basis of what I had experienced during both the day and evening program. I felt that there was a definite need to avoid a standard classroom situation and that it was of the utmost importance that the facilities be as flexible as I could make them. Therefore, in the classroom, we used trapezoidal tables, and plastic stacking chairs that

could be moved around. Equipment was arranged so that it could be moved on tables that had casters. In the laboratory, we had counters, a sink, storage, department library and several display areas, all for the purpose of teaching advertising, display and showcard lettering. This was basically what we had available in the second year. Later on, of course, we added several new classrooms and provided a number of display windows and increased the laboratory size. This was done as a result of the growth in enrollments in the program. I could describe our facility as one that reflected flexibility of need as it grew.

QUESTION NO. 21: Did you have club activities for your students?

Answer: If you mean were we affiliated with the Distributive Education Clubs of America organization, I would have to say no. At that time there was no such organization in the state, and so we had no official club activities as such. The students, however, established an organization of their own in which they did such things as invite speakers to the class, arrange field trips, and organize social get-togethers where they invited other students in the school. Most of these activities were tied in with some phase of the classroom instruction. Out of this informal organization grew a student organization for all students in the school who were majoring in business. It was not until three years later when I was involved in starting another new post high school program that the state affiliated with DECA. We were then able to do a great many more things primarily because by then we had a recognized organization, large student enrollments, and the size of our staff had also grown in proportion.

QUESTION NO. 22: You have mentioned that you were involved in the adult education program. Will you briefly explain your activities in this area?

Answer: Adult education in some of the divisions of the school constituted approximately fifty per cent or more of the program. Almost all of the staff were involved in adult education in one form or another. This was quite an experience for me. I had never worked with adults in an evening class, nor had I ever had an opportunity to observe an evening school class in operation. The director of the evening school program was very helpful. I gained some insight into the operation of an evening school program as a result of the inservice training program that was conducted, but I still did not feel prepared to conduct an evening school class that fall semester. One of the faculty members told me that teaching adult classes would be similar to the experience that I was having with my post high school students. That was true for the most part, because I did have a rather unusual group of post high school students that first year. That is, student characteristics in the post high school classes were similar to those found in the adult evening school classes that I conducted. This similarity was not as true in later years, however. The post high school students today seem younger and a great deal less experienced. I think that they probably typify the type of student that is participating in most post high school classes. If I were to start a new post high school program today- the contrast between adult classes and the post high school classes could be more noticab! and might present more problems than I experienced ten years ago. I do not know whether you want me to get specific about these differences, but

perhaps I can summarize by saying that generally the major differences were in the student's occupational experience and the need in an adult class to present material that could be used the next day, rather than sometime after graduation. Instructor occupational experience was extremely important. In later years when I had an expanded staff I usually encouraged a new person on the staff to teach something in the evening school that was his or her strong suit, and if possible to teach something that involved a skill, such as display, showcard lettering, checker or cashier training, something that would take the pressure off in the beginning in order to provide a little bit of orientation for the inexperienced person. I wish, of course, that I had been aware of this when I started, but because I was not, I jumped right into a situation in which I felt that was caught short. My first adult education class came as a result of one of my contacts in soliciting students for the post high school program that year. One of the employers of a large firm in town expressed an interest in the post high school programs and also indicated an interest in a class being offered for his people in the evening school. Since I was anxious to enroll as many students as I could, I indicated that I would be willing to provide this class for him. I later found out that he had in mind something specifically in the area of credit and the problems that go along with credit as they relate to bulk oil sales. My experience in that area was practically nil. Needless to say, I was in a panic prior to this class. My approach with these people was to discuss some of the basic principles of credit as I had experienced them myself, but as the class progressed I realized that I was not meeting the needs of these

because they were concerned with how I could help them solve the problems that they had. Luckily I realized this and changed the whole direction of the class. I found that an adult evening school class is not a matter of presenting what you think the class should have, but rather what they can take away and use in a practical manner to improve their situation in the job that they were involved in, or to give them some background in order to move into a new occupation. I think that in giving these people some direction they actually solved their own problems while I served as a resource person and provided materials and activities directed towards solving their problems. It might be important to mention also that at times it would be easier not to get involved with adult education. I, of course, had no choice. As I look back on this experience, several things came out of it. Because I was fortunate to have had some success in that first class, I completed that first year of my teaching experience by offering several evening school courses. Many of the participants in the evening school program were also parents of prospective students. It seems that there must have been three or four students who enrolled in my post high school program the second year who did so as a direct result of the experience that their parents had the year before in the evening school program.

QUESTION NO. 23: Would you comment on the second post high school program that you started?

Answer: This was three years later and by then I had learned a great deal about post high school programs. The task was easier because I had the experience behind me. The administration in the new school had been part of the administration in the school where I first began teaching

and so they were oriented to distributive education at the post high school level. One of the things that we did not do was to start the program the first year that I was on the job. During that first year I spent my time establishing the curriculum, handling the promotion, and teaching adult education. This, of course, took the pressure off of us when the program actually began. Much of the ground work had been covered by then. That program today has about 250 full-time day students enrolled and I believe around 2,000 students who participate in the evening school program each year. I cannot emphasize enough the importance of having a solid foundation upon which to build a program backed by an understanding administration.

QUESTION NO. 24: How would you summarize your first year's experience as a post high school teacher-coordinator?

Answer: I do not know whether I can summarize it. I have already given some indication of how I felt about what I did. I think that any teacher who comes away with a good feeling about what he did during his first year would say that they had experienced a successful year. I do not know that the experience that I had was unlike the experience that a number of distributive education coordinators at the post high school level have experienced in their first year. In the last ten years, the post high school distributive education program has as you know developed tremendously, both in terms of numbers and in the types of offerings that are being made available. Obviously much more pioneering must be done, but in some ways the task is a little easier because there are people to talk to now. There are resource people, guides, textbooks, and so-on, that are available for the inexperienced person to refer to. There is also more and more interest on the part of teacher education

institutions to provide specific professional training for people who had indicated an interest in becoming post high school instructors or coordinators. I can just go back and say that I thought that I had had a successful year, maybe successful because I got through it. I do not know that I accomplished all that I wanted to accomplish. For that matter, I did not know what I wanted to accomplish, because of my complete unfamiliarity with the situation. At the end of the first year I recommended to the administration that we change our program to a full two-year program in line with all of the other divisions in the school. This was approved and with this approval came the addition of other staff members. This whole situation changed greatly in the second year. We had a small student group during that first year, but with the increase in instructional staff and with revision and improvement of the curriculum, we had about forty students the second year. Fortunately the experience that I had in stepping into a post high school program with very little background proved to be of great benefit to me in later years, because most of the people that have worked with me recently in what has developed into a much larger post high school program have had no post high school education preparation. Therefore, when asked by new distributive education personnel I have related my experiences to them and have left it up to them to pick and choose what they thought might help them. Those years were a terrific experience for me and I learned a lot, but I am not sure that I would want to do it over again.

QUESTION NO. 25: Do you feel that a teacher education program which is preparing teacher coordinators for high school positions can give sufficient background to qualify a person as a post high school coordinator instructor?

Answer: That is an extremely difficult question to answer. AS mentioned before, I was fortunate in that I went through a very fine teacher education program. Obviously if you are prepared for a particular area of education, it would seem logical that you would do a better job. I think I would have really been in trouble if I had not had any teacher preparation at all. As you know, it is possible to get involved in adult education without having had an extensive teacher education program. I can best answer your question by referring again to experiences that I had in later years when I had a greatly expanded staff of distributive personnel. I mentioned earlier that none of these people had any specific preparation in post high school education and I found myself upon their request doing considerable in-service work on an individual basis. I am sure that they would have felt more comfortable if they had received an orientation to post high school instruction and its problems combined with an opportunity to do some practice teaching in that same area.

QUESTION NO. 26: If you had it to do all over again would you choose post high school distributive education as your field?

Answer: I do not think there is any question about that. When I returned to graduate school, I had an opportunity to work with a high school program for one year and this gave me some basis for comparison. I thoroughly enjoyed the high school experiences, but in my case, I just felt that there was more self-satisfaction that comes out of a post high school program. I suspect that if I had started in a high school program I would have felt just the opposite. Post high school education is a tremendous challenge. In some ways it calls for a special kind of individual with a specialized kind of training for that field, just as

is the case with a high school program. With the expansion of distributive education programs at both post high and the high school level, it would seem to me that more and more colleges and universities are going to find themselves involved in meeting the demands of post high school programs by providing the qualified staff that is necessary to operate them. Just from one standpoint, if a post high school program develops at all, more than likely it will require several distributive education personnel to operate. Future programs will place pressure on all of us to do a good job in meeting these demands. It may perhaps require a change of philosophy on the part of some of us who are directly involved in the distributive education teacher-education programs.

GENERAL IMPLICATIONS FOR TEACHER EDUCATION

The title of this section implies the writer's desire to avoid specificity in identifying implications for all distributive education teacher education programs. It would seem that this task is best left to the desires of the reader if in fact the milieu of comments presented can provide a basis for drawing some meaningful implications.

GENERAL IMPLICATIONS:

. . .development of distributive education teacher education programs specifically designed to meet the needs of those persons interested in teaching at the post high school and adult level.

. . .exposure of all distributive education student teachers to post high school and adult education programs.

. . .a need to develop a means whereby individuals can be readily identified as prospects for teaching careers in post high school and adult distributive education programs.

. . .review of the professional and occupational (certification) requirements of both high school and post high school distributive education personnel to determine if meaningful distinctions can be made.

. . .promotion of research for the purpose of developing curriculum content and instructional materials.

. . .documentation of operative curriculums, and occupational specialities within curriculum--accessible to institutions considering the implementation of post high school and adult education programs.

. . .

This leaflet was developed by four distributive education teacher coordinators to provide guidelines for those involved in arranging a classroom setting for distributive education (DE) courses. Discussed are: (1) placement factors for a classroom, (2) classroom size, (3) classroom facilities, (4) classroom furniture and fixtures, (5) audio-visual teaching aids, and (6) planning the classroom layout. Three sample classroom layouts that have proven successful in other schools are presented. (MM)

PURPOSE OF REPORT

This leaflet is presented to provide guide lines for the establishment of Distributive Education Classrooms. It is felt this information will be helpful to administrators, architects, distributive education coordinators and others involved in providing an adequate classroom setting for the most effective teaching of distributive education courses.

Because of the nature of distributive education curriculum and the varied teaching methods used, it is desirable that a classroom be specifically designed to fit the special needs of this course. This not being possible, suggestions are made for the conversion of existing classrooms to D.E. needs.

This study is not meant to be neither exhaustive nor restrictive, but rather a functional basis for practical in-the-school planning.

GOALS OF DISTRIBUTIVE EDUCATION

Since most effective planning will come from an understanding of what the distributive education program is, it is desirable that this purpose be made clear.

Distributive Education is a course of instruction to promote training and practical experience in distributive occupations. These include such occupations as are found in the retailing, wholesaling, storing, transportation, risk bearing, customer contact, selling, advertising, display, sales promotion, and management. It involves all the activities of getting a product or service from the producer to the consumer.

D.E. provides a combination of classroom work and paid practical experiences on the job. It relates the classwork to future occupational situations by simulating realistic job experiences in the classroom whenever possible.

The typical Distributive Education curriculum includes salesmanship, display, advertising, merchandising, speech, math, English, job application, grooming, stock keeping and business management.

TEACHING METHODS OF DISTRIBUTIVE EDUCATION

The effectiveness of D.E. teaching leans heavily on activity. The learning by doing situation is stressed. Book learning is followed closely by application of the learning to job use. This is done both in the classroom and on the job. It follows, therefore, that the classroom should serve as a laboratory to provide a true-to-life atmosphere for recreating job situations. As an example: Display work is best learned by allowing the student to apply his knowledge to the making of an actual display. As another example: Store selling is best learned in a store setting. This calls for sales counters, registers, packaging supplies, sales slips, shelving and display fixtures.

A classroom which most closely duplicates the conditions students will encounter on their job stations will serve as the best teaching laboratory for the teacher. The value of such a realistic classroom as a tool to augment the teaching of a good Distributive Education coordinator can hardly be over stressed.

While the ideal classroom situation presented in this report is not mandatory to a good Distributive Education program, it is certainly highly desirable and should be stimulated as nearly as conditions allow.

PLACEMENT FACTORS FOR A D.E. CLASSROOM

The nature of the Distributive Education course makes it one of the most effective public relations factors in a school. It represents an extension of the school into the community and vice versa. The teaching methods and the curriculum

of Distributive Education give it a certain flair that attracts much favorable comment both within the school and from the community. To capitalize on this interest the Distributive Education classroom should be placed near the center of activity of the school. Positions close to the administrative offices of the school, or near the entrance lobby are often thought to be most effective. It is especially good to have a large display window facing unto the most heavily traveled passage of the school as a show case of what practical knowledge Distributive Education students are learning.

Physical considerations that must be taken into account are:

1. Adequate room size
2. Sufficient storage areas
3. Proximity to counseling area
4. Availability of telephone
5. Plumbing facilities for sink
6. Abundant electical outlets and lighting
7. Effective display window visable to corridor

The factors involved in making the above considerations are detailed at appropriate places in the remainder of this report.

CLASSROOM SIZE

The space needed for an adequate Distributive Education program will vary with the number of students enrolled in the classes and the type of curriculum the coordinator follows.

The size of D.E. classes ranges from 15 to 30 students with 20 to 25 usually considered as ideal. Because of the nature of the program, a class of more than 30 should not be permitted.

A good rule of thumb in estimating space needs is to allow approximately 30 square feet of floor space per pupil. Using this guide with a class of 30, we arrive at the need for a classroom of 900 square feet. It is immediately obvious that many multi-purpose classrooms in our present schools are just not adequate. If we are to include storage and counseling areas within the classroom area, a room measuring 25 ft. by 40 ft would probably prove to be sufficient. The suggested floor plans at the end of this report are in keeping with the rule of thumb of 30 sq. ft. per pupil. These should be helpful in seeing the suggested use of space and room layout for most efficient use.

The need for adequate locked storage area and a separate counseling area as part of the Distributive Education classroom planning cannot be over stressed. The amount of display and art materials to be stored is great and the need for placing it under lock and key is obvious. Because of the nature of personal and job problems that arise with teenagers working outside the school, a private place where the counselor and student can confer is a must.

CLASSROOM FACILITIES

One of the extra considerations needing attention is the placement of a sink in the D.E. classroom. The D.E. curriculum is similar to that of the art department

in the use of craft materials and paints. Distributive Education students are badly handicapped by lack of an easy place to wash out paint brushes and lettering pens, to mix pastels, and thin paints. When this is not provided in the classroom, the effect of students going in and out of the classroom can be a disruptive influence on the rest of the school.

Availability of a telephone within the Distributive Education area is highly ideal. The efforts of the coordinator to properly supervise students, and maintain contacts with the students' homes and job stations can hamper the merchants greatly if he must depend on the school office phones. Students are required to personally inform the coordinator by phone of the reason for any school absence. The coordinator in turn must contact the employer to ascertain that he has been informed that the student is unable to go to work that day. There are a great many occasions which arise in D.E. coordination that can be quickly handled by a phone call, but which might build into a more serious problem if a phone is not readily available. In the event that it is not possible to provide a phone within the classroom, it is extremely important that one be close at hand.

The lighting and electrical facilities of the D.E. classroom should be in keeping with conditions found in modern stores. A minimum of forty-foot candle of illumination should be evenly distributed over the room. Florescent fixtures are best as they provide a light most comparable to daylight and tend to be most glare free.

Lack of sufficient electrical outlets is a common fault in D.E. classroom planning. There just never seems to be enough of these, nor at the right places. The D.E. students move equipment, displays and lighting around to duplicate various

store settings and they are hampered by lack of outlets. Set rules on outlet placement cannot be given but a guide would be to place several double receptacles along each wall. In the display areas, an outlet strip the length of the area would be excellent. Provision should be made for adequate overhead lighting in the form of spots and floods in display areas. Outlets must be provided in sales area use of the electrical cash register.

Trying to economize on the amount of lighting and electrical outlets is a false economy since later remodeling to make it usable will prove much more costly.

DISPLAY WINDOW

One of the most valuable teaching aids in D.E. is the display window. This should approximate a typical store display window as nearly as possible in both size and facilities. A plate glass area of 7 ft. x 10 ft. with a display depth of 5 ft. would be excellent. Arrangements for overhead lighting and a grill work for suspension of displays is essential. Provision should also be made for easily changing the backgrounds or the display.

The display window should be located where it will receive the maximum attention in the school. Student displays will be of great interest to other students. Distributive Education students will take much greater pride in making displays that receive maximum viewing by their peers. The display window is often a source of good public relations for the school as a demonstration of the practical modern teaching taking place within the school.

Access into the display window from the storage area of the Distributive Education classroom is a most desirable arrangement; however, it is not always possible.

CLASSROOM FURNITURE AND FIXTURES

Of prime concern in establishing the proper D.E. setting is the choice of student furniture. The general concensus of opinion among D.E. educations is that movable student tables are superior to other types of desks for D.E. classes. Typing tables have proven satisfactory. Their flat surface is ideal for such projects as ad layout and poster painting. In addition to the work suface they are easily mobile into varied classroom arrangements. They are readily changed from a formal classroom into a conference arrangement as the occasion demands.

A display case and a sales counter similar to those found in the typical store are essential classroom furniture. Many classrooms are using the Ellinger display unit complete with a 3-way mirror. The combination of a display case, sales counter, and the Ellinger unit at the front of a classroom forms a very realistic store atmosphere.

The above forms the perfect setting for a learning by doing type of instruction.

Chalk board areas equal to other classrooms are necessary. Bulletin board areas, however, need to exceed those normally found in standard classrooms. D.E. students make good use of bulletin space for club news, displays, posters, merchandise information, display schedules, announcements and class related materials.

Administrative equipment should include a teacher's desk and chair, file cabinets, storage cupboards and wardrobe closet.

Many coordinators have reported that a storage unit containing individual tote drawers for each student have proven very useful and might well be considered in setting up the classroom fixtures. These have the advantage of each student being able to maintain his own materials and unfinished projects where they are readily available to him and will not be distrubed by others.

There is much need in Distributive Education project work for large flat surfaces upon which to work. Tables of the type often used in school cafeterias are excellent for this purpose and at least two should be available in each classroom.

Another essential item is the bookcase for the D.E. reference library. D.E. students make many special reports, write essays, and do extra reading to meet their personal interests and the needs of their jobs. The reference library must be readily accessible in the classroom and properly stored in a sturdy bookcase. You also need blinds or drapes to darken the room for movies or films.

To summarize the items discussed as necessary considerations in planning classroom furniture and fixtures the following list may be helpful:

1. Choice of proper student furniture
2. At least one display case
3. A sales counter
4. Store type display unit including 3-way mirror
5. Chalk boards
6. Bulletin boards
7. Teacher's desk and chair
8. File cabinet for records (4 drawers)
9. Storage cupboard with lock
10. Wardrobe closet with lock
11. Student tote drawer storage unit
12. Large tables for work areas
13. Bookcases for reference library
14. Blinds or drapes to darken room

AUDIO-VISUAL TEACHING AIDS'

D.E. coordinators make extensive use of the latest methods in teaching and use appropriate audio-visual aids whenever these will prove valuable in the teaching situation. To make maximum use of the various teaching aid materials available to them and to utilize the most effective learning techniques possible, the following list of items should be readily accessible to the D.E. coordinator.

1. Tape recorder
2. Slide projector (sound) 35mm
3. Movie projector (sound) 16 mm
4. Opaque projector
5. Screen

6. Record player (3 speed)
7. Scales computing
8. Cash register
9. Adding machine
10. Flannel board
11. Display fixtures (various pieces)
12. Male and female mannequins
13. Turntables and motors for motion displays
14. Duplication equipment (Ditto or Mimeo)
15. Silk screen printing outfits

PLANNING THE CLASSROOM LAYOUT

When the needs of the D. E. classroom have been determined as to size, facilities and equipment in accordance with the foregoing discussion, the next step is planning how the room may be most effectively arranged. This is easily done by using a piece of graph paper and drawing a rough line outline of the actual space available. Using pieces of paper cut to represent the proper scale size of the furniture and fixtures to be used, one can get an excellent idea of how the room may be set up. It is possible to move the scaled pieces of paper around until the most satisfactory arrangement is found.

There is no such thing as a perfect D.E. classroom that will fit all situations. The D. E. classroom that is perfect for your school is the one which best meets the needs of your program and best utilizes the available space to serve the needs and interests of your D.E. students.

A group of sample D.E. classroom layouts that have proven successful in other schools are given in the final section of this report to assist you in planning your classroom. It is believed that you will find it valuable to see how other schools have planned their D.E. classrooms.

If further assistance is needed in your planning it is suggested that you contact a member of the D.E. staff of the State Department of Education, or the D.E. Materials Lab at the Ohio State University. These people are expert on this subject and will be glad to be of assistance.

INTRODUCTION AND PURPOSE

This booklet provides general information regarding the program of Project Grants for Improvement in Nurse Training. The specific steps in applying for a grant are set forth in "Instructions for the Preparation and Submission of Applications for Project Grants for Improvement in Nurse Training."

Under this program, grant awards are made for the additional costs to schools of nursing of projects designed to improve, strengthen, or expand programs to teach and train nurses. Projects for establishing new courses; exploring curriculum; demonstrating new methods of instruction, increasing student enrollment and better utilization of teachers are examples of the many possible topics that might be developed.

This program operates also under the general Public Health Services policies governing training grants as set forth in the Grants for Training Projects: Policy Statement, Revised July 1, 1967.

Funds are not available under this program for trainee expenses or stipends.

REQUIRED COMPLIANCES

Civil Rights: The training project grant must be administered in conformance with the Civil Rights Act of 1964, the Regulation (45 CFR, Part 80) issued pursuant thereto by the Department of Health, Education, and Welfare, and the Assurance of Compliance (Form HEW 441) filed with the Public Health Service. If an applicant has not previously filed an Assurance of Compliance, the form should accompany the application when submitted.

If the project will involve a contract or other arrangement with another entity or individual to provide services or other benefits under the project, the applicant organization as grantee must obtain an agreement in writing from such individual or entity that he or it will carry out its functions under the contract or arrangement with the Federally assisted project in accordance with Title VI of the Civil Rights Act of 1964 and the Regulation.

Safeguarding the Rights and Welfare of Individuals Including Clinical Research and Administration of Personality Tests and Questionnaires: If the project includes, or is likely to include, investigations involving human subjects, including clinical research and the administration of personality tests and questionnaires, the Public Health Service requires that the applicant organization provide prior review of the judgment of the project director by a committee of his institutional associates. This review should assure an independent determination: (1) of the rights and welfare of the individual or individuals involved; (2) of the appropriateness of the methods used to secure informed consent, and (3) of the risks and potential medical benefits of the investigation.

Applicant organizations must be in compliance with this policy before the application can be accepted for processing and review. Applicant organizations which have filed an Institutional Assurance with the Public Health Service and have had the assurance accepted, should make specific reference to this certification in the application. An applicant organization which does not have an accepted institutional assurance on file with the Public Health Service and intends to request support of a project requiring it, should request information for submitting such an assurance with the Division of Nursing of the Public Health Service.

NATURE OF ASSISTANCE

Eligible Applicants: All public or nonprofit private diploma, collegiate (undergraduate or graduate), or associate degree schools of nursing are eligible to apply if the program in nursing is accredited or has received reasonable assurance of becoming accredited by the time the project is completed. The Commissioner of Education has designated the National League for Nursing as the accrediting body.

Grant Duration and Amount: The length of time for project grant support will vary from 1 to 5 years depending upon the objectives and methodology of the project plan and the justification given for the time requested. Under no circumstance will Federal support exceed 5 years.

Allowable Project Costs: The applicant may request grant funds for those direct costs necessary to the conduct of the project, and an allowance for indirect costs. Refer to the Policy Statement for examples of allowance for direct costs.

BUDGET

The budget request should be appropriate for the project proposal. The items included should be directly related to the project plan and must be for additional costs incurred by the school to carry out the project over and above the normal and expected operating expenses of the school. Examples of additional costs might be:

1. Salaries for project personnel who are not currently on the staff of the applicant organization but have to be hired as "new" personnel.

2. Salaries for staff already employed by the applicant institution if they are reassigned to the project and it is shown how this results in an additional cost to the school.

Salaries for project staff already employed on the staff of the applicant institution are not eligible if the person's previous functions are merely distributed among other staff members without increasing costs to the school. In order for salaries to be eligible in this situation, the personnel would need to be replaced. The project proposal should contain a statement explaining plans for replacement.

3. Consultation fees. (Excluding persons employed by the applicant institution.)

4. Technical services.

5. Equipment not already available in the institution but essential to carry out the project.

APPLICATION AND AWARD PROCEDURES

Applications for Improvement in Nurse Training project grants must be submitted on Form 4885-1 and prepared in accordance with the instructions attached thereto. An original copy and two carbon copies of the application should be submitted directly to the Division of Nursing of the Public Health Service.

All applications are subject to review by the Improvement in Nurse Training Project Review Committee which makes recommendations to the National Advisory Council on Nurse Training with respect to the applications. The Council generally meets three times a year -- March, June, and November.

Deadlines for receipt of applications are as follows:

Applications Should Be Postmarked No Later Than	For Projects To Be Reviewed In	Earliest Starting Date for Project
February 1	May	August 1
July 1	November	February 1
November 1	March	June 1

Schools are encouraged to submit applications as much in advance as possible to expedite the process of review.

Review Process: Improvement in Nurse Training project grant applications are initially reviewed by appropriate Public Health Service staff for completeness and compliance with grant policies. They then are referred to the Project Grant Review Committee, an expert advisory group comprised of professional members outside the Public Health Service, for review as to educational soundness, technical competency, project content and for recommendation to the National Advisory Council on Nurse Training. The Council makes a final recommendation to the Surgeon General based on the criteria listed below. All applications recommended for approval are rated as to priority for funding.

Review Criteria: In reviewing project applications, consideration is given to (1) the extent to which the project will contribute to general improvement in teaching and training nurses of the kind involved; (2) the extent to which the project will aid in attaining a wider geographical distribution throughout the United States of high quality schools of the type involved and (3) the relative need in the area in which the school is situated for nurses of the type trained in the school.

In addition, the following factors will be considered:

1. Degree to which project objectives are clearly established, are attainable, and can and will be measured.

2. Availability and adequacy of the personnel, facilities, and other resources needed to carry out the project.

3. Potential contribution of the project to improving the teaching program in the school of nursing submitting the application.

4. The organization's plans to continue the activity as an ongoing part of the educational program after termination of Federal assistance, if such continuation seems advisable.

5. Plans for evaluating outcomes of the project.

6. Arrangements for communicating findings.

Approval: Improvement in Nurse Training project grant applications are approved by the Surgeon General or his designee, taking into consideration the recommendations of the National Advisory Council on Nurse Training. Determination as to which approved projects are to be funded is made on the basis of the total grant funds available and the priority rating of each of the applications recommended for approval.

The applicant will be notified in writing of the approval or disapproval action taken on the application.

OTHER INFORMATION

Award: Approved applicants will receive a Notice of Project Grant Awarded, the formal award document, which sets forth the beginning and ending dates of the project period, the amount of the award for the current grant period, the approved budget by category amounts, and the general level of support recommended for the remainder of the project period.

Grant Payments: If the grantee organization has received awards from other Public Health Service grant programs which are being paid under a letter of credit system or other cash control system, the payment for Improvement in Nurse Training project grants will be incorporated into the same system. For other projects, payment will be made quarterly.

Project Continuations: Schools with grants approved for Federal support for periods of more than 1 year must submit a continuation application for each successive 12-month period. These applications must be submitted approximately 90 days prior to the end of each 12-month portion of the project period. Grantees will be contacted some time before this deadline and provided with the necessary

continuation application forms and instructions. A report on project accomplishments to date is an integral part of the application for continued support of a project. Contingent on the satisfactory development of the project, continuation applications have first claim on available funds.

Revisions: Public Health Service approval must be secured to revise a project which has been approved. Approval by letter may be sought for such items as a change in project director, a change in the project period, or a limited change in the scope, character, or activities of a project.

Extensive changes in the project's scope or activities require submission of a revised application, to be processed and reviewed as the initial application was reviewed.

Other Governing Policies: Refer to Policy Statement for patent requirements, accounting and auditing, reports, etc.

Additional Information: Further information and consultation concerning project grants and copies of applications and other forms may be obtained from the Division of Nursing of the Public Health Service.

CONTEXT IN WHICH PROJECT GRANTS ARE PLACED

The purpose of the Nurse Training Act of 1964 is to increase the supply of well qualified nurses in the United States by a variety of approaches -- construction grants, payments to diploma schools of nursing, professional nurse traineeships, loans to nursing students, and project grants for improvement in nurse training. The first four of these approaches include provisions related to increasing the number of nursing students, increasing and improving the facilities in which nursing education programs are carried out, providing financial assistance to carry out an educational program, and increasing the number and the level of preparation of teachers, administrators, and leaders for schools of nursing services. The fifth approach is through the Nursing Education Program, and it is in this context that the project grants for the improvement in nurse training occur.

SCOPE OF THE PROJECT GRANTS

President Johnson, in his message to Congress on February 10, 1963, stated that he recognized the need for increasing nursing school enrollments "...but larger enrollments are not enough. The efficiency of nursing schools must be improved. I recommend authorization of grants to ... help the schools perfect new teaching methods."

The broad objectives of this section of the Nurse Training Act -- improving, strengthening, and expanding nursing education programs -- are accomplished by projects directed toward specific and clearly delineated goals. The grants provide schools of nursing with funds to meet the additional costs of these goals.

The objective in making these grants available is to encourage nursing educators to develop projects that will promote better learning, better teaching, and better utilization of teaching personnel by such methods as:

> Incorporating more widely into nursing education programs the results of experimentation relating to the education process in such areas as general education, psychology of learning, physical science, social science, humanities, and nursing.
>
> Improving methods currently being used to help students learn more effectively and efficiently.
>
> Trying out different ways to utilize the time and talents of teaching personnel more effectively and efficiently.
>
> Developing new approaches to nursing education.

The following statements, which were brought out in the Congressional committee hearings on the project grants section of the Nurse Training Act, help further to clarify the scope of project grants for improvement in nursing education:

> Considerable experimentation with methods that promote better teaching and better use of teaching personnel has been going on in the field of education. These methods need to be more widely incorporated into teaching of nursing. The project grants offer opportunities to schools to improve their methods and thereby enhance quality of instruction.

Many newer teaching concepts and methods could be applied advantageously to nursing education. Both teacher time and learning time would be reduced. This is of utmost importance in view of the shortage of teachers and the tremendous increase in the body of knowledge necessary for modern nursing.

Schools of nursing must be encouraged to experiment with new and better ways of preparing students.

Efforts to develop new approaches to nursing education should be fostered.

The project grants section of the law provides grants for developing new and improved methods of training.

Project grants would support a movement toward improving the quality of nursing education. Increasing enrollment should not be considered as sole criterion of Federal assistance.

The projects submitted would require, if they were to be approved, a major improvement in the program of nurse training. It would not be a substitute for the normal and expected operating expenses of the school.

The Nature of the Proposal -- Content and Form: These grants are intended primarily to support projects that answer questions or solve problems concerned with improving the effectiveness and efficiency of learning and teaching and with improving the utilization of teaching personnel. The project proposal, therefore, should delimit and discuss in some depth the question(s) or problem toward which work will be directed, should discuss the reasons for selecting the project (the nature and significance of the question(s) or problem, and the related work already accomplished or in progress at the time the project proposal is written).

The proposal should contain specific aims being worked toward, a plan for carrying out the work necessary to accomplish the aims and a plan for determining to what extent the aims are achieved.

The Institutional Orientation and Environment: Factors in the institution in which the project is to be carried out affect the success of the project; that is, the way the project fits into the philosophy and objectives of the institution as a whole; the interest, degree of involvement, qualifications and provision for adequate time of the personnel, other than the project director, who must carry out the work of the project; and the support of the administrative personnel. The application should contain a brief statement on these and any other pertinent factors.

Facilities, equipment, and other supporting services which will be furnished to the project, as well as the availability of consultation in the institution to the project director and personnel, should be indicated.

MF AVAILABLE IN VT-ERIC SET.
Iowa State University Bookstore, Iowa State University, Ames, Iowa 50010 ($.45).
Pub Date - Aug66 28p.

*HOME ECONOMICS EDUCATION; *STUDENT EVALUATION; *CLOTHING INSTRUCTION; TESTING; JUNIOR HIGH SCHOOLS; HIGH SCHOOLS; *TEST CONSTRUCTION; *ACHIEVEMENT TESTS

Guidelines for teacher use in evaluating student knowledge of clothing construction were developed through research projects and trial use in Iowa schools by heterogeneous school groups. Appropriate versions of materials listed according to grade level are: (1) the Finger Dexterity Questionnaires, (2) Survey of Object Visualization, and (3) Clothing Construction Pre-Tests. Directions and tables for conversion and interpretation of the combined test scores in order to classify students according to ability are given. The Finger Dexterity Questionnaire and both the Senior and Junior High School Clothing Construction tests are included in the document. Sources of the Miller Object Visualization tests are listed. Other evaluation materials for home economics areas, all using similar formats, are available as VT 005 746-VT 005 757 (ARM Summer 1969). (FP)

SUGGESTIONS FOR USING

One of the most difficult decisions a homemaking teacher has to make in teaching clothing construction is that of the level of ability of each pupil, particularly if she has not had the pupil in class before. Yet so much depends on the wisdom of this decision. If the garment chosen by the pupil is fitted to her ability level, she is more likely to have a greater sense of achievement and, hence, a greater liking for sewing. Also the pupil will learn more if the pattern and fabric chosen are neither too difficult nor too easy to use. In addition the teacher is more likely to enjoy teaching the unit.

This material will help the teacher, too, in dividing her class into ability groups in clothing construction and adapting her teaching to the needs of the group.

This material was developed as part of a research project and the results are based on the abilities of over 400 high school pupils in six Iowa schools. The classification system for each grade level is designed to place pupils in ability group like those of pupils in the sample of schools taking part in the study. Hence in a given class they may not be divided so that 1/4 are in the upper, 1/2 in the middle, and 1/4 in the lower group. As teachers know, classes vary from year to year in their mental ability, so also they may vary in their construction ability.

The materials to use at each grade level are as follows:

8th grade	-	Finger Dexterity Questionnaire Survey of Object Visualization Clothing Construction Pre-test,	(Junior High)
9th grade	-	Finger Dexterity Questionnaire Clothing Construction Pre-test	(Junior High)
10th grade	-	Finger Dexterity Questionnaire Clothing Construction Pre-test	(Senior High)
11/12th grade	-	Finger Dexterity Questionnaire Clothing Construction Pre-test	(Senior High)

Supplementary Information on Instructional Material

Provide information below which is not included in the publication. Mark N/A in each blank for which information is not available or not applicable. Mark P when information is included in the publication. See reverse side for further instructions.

(1) Source of Available Copies:
Agency University Book Store, Iowa State University
Address Ames, Iowa 50010
Limitation on Available Copies none Price/Unit $ .45
(quantity prices)

(2) Means Used to Develop Material:
Development Group Heterogeneous school groups
Level of Group
Method of Design, Testing, and Trial Developed through research projects and trial use in Iowa schools. Cooperative project between the Division of Vocational Education, State Dept. of Public Instruction and Iowa Agriculture Experiment Station (Project 1215),

(3) Utilization of Material:
Appropriate School Setting Comprehensive high school
Type of Program High school classes
Occupational Focus Homemaking
Geographic Adaptability
Uses of Material Models for test items and evaluation devices
Users of Material Home economics teachers

(4) Requirements for Using Material:
Teacher Competency Background in testing and evaluation
Student Selection Criteria

Time Allotment

Supplemental Media --

FINGER DEXTERITY QUESTIONNAIRE *

_____
Name

1. Do you play the piano or organ? _____
   How many years have you played it? _____

2. Do you play a string instrument like a violin, guitar, cello? _____
   How many years have you played it? _____

3. Do you play a wind instrument like a flute, clarinet, bassoon? _____
   How many years have you played it? _____

4. Do you type? _____ What is your best typing speed in words per minute? _____

5. Do you knit? _____
   How many years have you been knitting? _____

6. Do you crochet? _____
   How many years have you been crocheting? _____

7. Did you make doll clothes? _____
   Often? _____
   Sometimes? _____
   Rarely or never? _____

8. List the garments (aprons, skirts, blouses, dresses, etc.) in these columns that you have made for yourself or others. If you have made <u>more</u> than 1, give the number.

Garments at School	Number	Garments as a 4-H Project	Number	Garments at Home	Number

*Method of Scoring - see back side of sheet

KEY FOR SCORING FINGER DEXTERITY QUESTIONNAIRE

	Junior High School (8 & 9)		Senior High School (10 & 11/12)	
	No. of years	Score	No. of years	Score
1. Playing the piano, organ, or accordian	0	0	0	0
	1 - 2	1	1 - 2	1
	3 - 4	2	3 - 4	2
	5 - 6	3	5 - 6	3
	7 or more	4	7 or more	4
2. Playing a string instrument	0	0	0	0
	1 - 2	1	1 - 2	1
	3 or more	2	3 or more	2
3. Playing a wind instrument	0	0	0	0
	1 - 2	1	1 - 2	1
	3 or more	2	3 - 4	2
			5 or more	
4. Typing	Responses		Words per minute	
	No	0	0	0
	Yes	1	Under 20	1
			20 - 39	2
			40 - 59	3
			60 or more	4
5. Knitting	No. of years		No. of years	
	0	0	0	0
	1 - 3	1	1 - 3	1
	4 or more	2	4 or more	2
6. Crocheting	0	0	0	0
	1 - 3	1	1 - 3	1
	4 or more	2	4 or more	2
7. Making doll clothes	Responses		Responses	
	No	0	No	0
	Rarely or never	1	Rarely or never	1
	Sometimes	2	Sometimes	2
	Often	3	Often	3
8. Previous sewing *				
Garments	No. of times made		No. of times made	
a. Slippers, collars, handbag, scarf, hat or cumberbund, toga, belt	0	0	0	0
	1 - 2	1	1 - 2	1
	3 or more	2	3 or more	2
b. Apron, skirt, blouse, shorts, slacks, duster, pajamas, half slip, night gown	0	0	0	0
	1 - 2	2	1 - 2	2
	3 - 4	4	3 - 4	4
	5 or more	6	5 or more	6
c. Jumper, dress, coat, jacket	0	0	0	0
	1 - 2	3	1 - 2	3
	3 or more	6	3 or more	6

*The score for item 8 (a+b+c) is determined by the number of times garments were made in each group regardless of whether they were made in school, in 4-H or at home. The scores for items are summed to secure the total score.

Weighted Scores to be used in Estimating Clothing Construction Ability of 8th Grade Pupils

Table of Weighted Scores

Clothing Construction Pretest (Junior High) (Raw score x .0613 = weighted score)		Survey Test by Miller * (Raw score x .0283 = weighted score)		Finger Dexterity Questionnaire (Raw score x .0387 weighted score)	
Raw Scores	Weighted Scores	Raw Scores	Weighted Scores	Raw Scores	Weighted Scores

(over)

DIRECTIONS for classifying 8th grade pupils into three ability groups:

Use the table to convert the raw scores to weighted scores for the three tests. Add the weighted scores and subtract 1.8541. This number tells you, when compared to the classification system below, whether a pupil is like that of the upper 1/4, middle 1/2 or lower 1/4 of 8th grade pupils.

Classification System

high (Upper 1/4) = above + .3605

medium (1/2) = - .3605 through + .3605

low (lower 1/4) = below - .3605

For example, a pupil received these raw scores: Clothing Construction Pretest 15, Survey Test by Miller 8, and Finger Dexterity Questionnaire 3. The weighted scores are .9195, .2264, and .1161 respectively. The total of these scores is 1.2620. 1.2620 - 1.8541 = -.5921. By consulting the classification system you see that -.5921 falls within the low range of ability. Therefore, you would encourage this pupil to choose a construction project which is simple for an 8th grade pupil.

DIRECTIONS for securing the Survey Test

The Survey of Object Visualization by Miller can be obtained from the California Test Bureau, 110 South Dickinson Street, Madison 3, Wisconsin. Their catalog contains prices of the Manual, Tests, and Answer Sheets.

DIRECTIONS for administering and scoring the tests.

The three devices (Clothing Construction Pretest, Junior High; the Survey Test by Miller, and the Finger Dexterity Questionnaire) can be administered separately any time before the unit on clothing construction. The amount of time pupils will need to react to these is approximately 30 minutes, exactly 25 minutes, and approximately 10 minutes respectively.

The Clothing Construction Pretest, Junior High, is scored by counting the number of correct responses.

See the back side of the Finger Dexterity Questionnaire Sheet for Scoring Key.

Weighted Scores to be Used in Estimating Clothing Construction Ability of 9th Grade Pupils

Table of Weighted Scores

Clothing Construction Pretest (Junior High) (Raw Score x .0738 = weighted score)		Finger Dexterity Questionnaire (Raw Score x .0542 = weighted score)	
Raw Scores	Weighted Scores	Raw Scores	Weighted Scores
1	.0738	1	.0542
2	.1476	2	.1084
3	.2214	3	.1626

35	2.5830		

(over)

DIRECTIONS for classifying 9th grade pupils into three ability groups:

Use the table to convert the raw scores to weighted scores for the two tests. Add the weighted scores and subtract 1.8586. This number tells you, when compared to the classification system below, whether a pupil is like that of the upper 1/4, middle 1/2 or lower 1/4 of 9th grade pupils.

Classification System

High (upper 1/4)	= above + .3868
Medium (1/2)	= -.3868 through + .3868
Low (lower 1/4)	= below -.3868

For example, a pupil received these raw scores: Clothing Construction Pretest 15, and Finger Dexterity Questionnaire 3. The weighted scores are 1.1070 and .1626 respectively. The total of these scores is 1.2696. 1.2696 - 1.8586 = -.5890. By consulting the classification system you see that -.5890 falls within the low range of ability. Therefore, you would encourage this pupil to choose a construction project which is simple for a 9th grade pupil.

DIRECTIONS for administering and scoring the tests.

The two devices (Clothing Construction Pretest, Junior High, and the Finger Dexterity Questionnaire) can be administered separately any time before the unit on clothing construction. The amount of time pupils will need to react to these is approximately 30 minutes, and 10 minutes respectively.

The Clothing Construction Pretest, Junior High, is scored by counting the number of correct responses.

See back side of the Finger Dexterity Questionnaire Sheet for Scoring Key.

Weighted Scores to be Used in Estimating Clothing Construction Ability of 10th Grade Pupils

Table of Weighted Scores

				33	2.3067

(over)

DIRECTIONS for classifying 10th grade pupils into three ability groups:

Use the table to convert the raw scores to weighted scores for the two tests. Add the weighted scores and subtract 2.6012. This number tells you, when compared to the classification system below, whether a pupil is like that of the upper 1/4, middle 1/2 or lower 1/4 of 10th grade pupils.

Classification System

High (upper 1/4)	=	above +.3935
Medium (1/2)	=	-.3935 through +.3935
Low (lower 1/4)	=	below -.3935

For example, a pupil received these raw scores: Clothing Construction Pretest 32 and Finger Dexterity Questionnaire 9. The weighted scores are 1.6672 and .6291 respectively. The total of these scores is 2.2963. 2.2963 - 2.6012 = -.3049. By consulting the classification system above you can see that -.3049 falls within the medium range of ability of 10th grade pupils. Therefore you would encourage this pupil to choose a construction project of average difficulty for 10th grade pupils.

DIRECTIONS for administering and Scoring the tests.

The two devices (Clothing Construction Pretest, Senior High, and the Finger Dexterity Questionnaire) can be administered separately anytime before the unit on clothing construction. The amount of time pupils will need to react to this is approximately 35 minutes and 5 minutes respectively.

The Clothing Construction Pretest, Senior High, is scored by counting the number of correct responses.

See the back side of the Finger Dexterity Questionnaire Sheet for Scoring Key.

Weighted Scores to be Used in Estimating Clothing Construction Ability of 11/12th Grade Pupils

DIRECTIONS for classifying 11/12th grade pupils into three ability groups:

Use the table to convert the raw scores to weighted scores for the two tests. Add the weighted scores and subtract 3.7890. This number tells you, when compared to the classification system below, whether a pupil is like that of the upper 1/4, middle 1/2 or lower 1/4 of 11/12th grade pupils.

Classification System

High (upper 1/4)	=	above +.4995
Medium (1/2)	=	-.4995 through +.4995
Low (lower 1/4)	=	below -.4995

For example, a pupil received these raw scores: Clothing Construction Pretest 33, and Finger Dexterity Questionnaire 13. The weighted scores are 1.9767 and 1.1791 respectively. The total of these scores is 3.1558. 3.1558 -3.7890 = -.6332. By consulting the classification system you see that -.6332 falls within the low range of ability. Therefore, you would predict that this pupil should choose a construction project which is simple for a 11/12 grade pupil.

DIRECTIONS for administering and Scoring the tests.

The two devices (Clothing Construction Pretest, Senior High, and the Finger Dexterity Questionnaire) can be administered separately anytime before the unit on clothing construction. The amount of time pupils will need to react to this is approximately 35 minutes and 5 minutes respectively.

The Clothing Construction Pretest, Senior High, is scored by counting the number of correct responses.

See the back side of the Finger Dexterity Questionnaire Sheet for Scoring Key.

CLOTHING CONSTRUCTION PRE-TEST
(Junior High)

This test is being given to find out what knowledge and skill you now have in sewing. It will not affect your grade in any way.

On the following pages are questions about sewing. Answer these questions on the answer sheet which accompanies this test. Choose the phrase which <u>best</u> completes the statement or answers the question, and mark (x) on the answer sheet beside the letter of this phrase. Be sure the number on the answer sheet is the same as the number of the test question.

This is no time limit, but you probably will be able to finish in this class period. If you do not understand any part of the test, ask your teacher for help.

WHICH SEAM WOULD YOU USE?

1. If you were asked to sew a 5/8 inch seam in your skirt, judging with your eyes you would make it the same width as the seam in:

   a. figure 1 above
   b. figure 2 above
   c. figure 3 above

2. If you were asked to sew a 3/4 inch seam, judging with your eyes you would make it the same width as the seam in:

   a. figure 1 above
   b. figure 2 above
   c. figure 3 above

III

IV
II
V

WHAT ARE THE FOUR PATTERN PIECES SHOWN

Look at the blouse pattern on the opposite page to answer questions 3 to 6.

3. Pattern piece I is the:
   a. blouse front
   b. blouse back
   c. sleeve

4. Pattern piece II is the
   a. blouse
   b. blouse back
   c. sleeve

5. Pattern piece III is the:
   a. collar
   b. pocket
   c. cuff
   d. sleeve

6. Pattern piece IV is the:
   a. collar
   b. pocket
   c. cuff
   d. sleeve

HOW SHOULD YOU TRIM AND CLIP SEAMS?

FIG. 1

FIG. 2

FIG. 3

7. Before turning the collar the seam should be:
   a. notched as in Fig. 1 above
   b. slashed as in Fig. 2 above
   c. left as in Fig. 3 above

WHICH WOULD YOU DO FIRST?

In making a garment it is usually desirable to perform certain processes before others, but sometimes it does not matter which order is followed. In making a blouse, which of the 3 processes should be done first?

8. a. Mark darts and buttonholes.
   b. Pin on pattern and cut out blouse.
   c. Remove pattern from fabric.

9. a. Stitch side seams together before sewing in bust darts.
   b. Stitch bust darts before sewing the side seams.
   c. It makes no difference.

10. a. Select the pattern you are going to use.
    b. Decide how much fabric to buy.
    c. It makes no difference.

11. a Stitch the bust darts.
    b. Stitch the front waist darts.
    c. It makes no difference.

WHAT DOES A PATTERN MARKING MEAN?

Look at each diagram and select the answer which correctly identifies the marking on the pattern.

12. This marking is for:
    a. a tuck
    b. a dart
    c. a notch for matching

13. This marking tells you to:
    a. place line on grain of fabric
    b. tuck on this line
    c. pleat on this line
    d. fold on this line
    e. place on fold of fabric

14. This marking means:
    a. it is the seam allowance
    b. place on fold of fabric
    c. gather between arrows
    d. pleat between arrows
    e. leave open for placket between arrows

15. This marking shows:
    a. the natural waistline
    b. where to lengthen or shorten the pattern
    c. where to join the blouse and skirt
    d. the opening on side seam
    e. where to attach the belt

16. Line 1 is
    a. the center front
    b. the front fold
    c. a tuck
    d. a pleat

17. Line 2 is:
    a. the center front
    b. the front fold
    c. a tuck
    d. a pleat

WHICH ANSWER BEST COMPLETES EACH STATEMENT?

18. You have a piece of cotton fabric with uneven ends. Both ends were torn when it was taken from the bolt. How can it be straightened?
    a. stretch fabric by pulling the short corner of each end.
    b. stretch fabric along both selvages.
    c. trim the ends so that they are even.
    d. press with an iron.

19. When fabric is cut on the bias it will:
    a. stretch more easily
    b. tear more easily
    c. ravel more easily

20. The best way to hem a cotton gathered skirt is:
    a. Turn raw edge under and stitch by machine, then blind stitch hem in place by hand.
    b. Machine stitch seam tape to cover raw edge, then blind stitch tape in place.
    c. Turn raw edge under and stitch hem by machine.
    d. None of these methods.
    e. Turn the raw edge under, then blind stitch hem in place by hand.

21. The best way to gather an apron would be to:
    a. use regular machine stitches.
    b. use lengthened machine stitches.
    c. use long basting stitches made by hand.

22. When placing the pattern and cutting the garment pieces:
    a. place all the pattern pieces on the fabric before cutting.
    b. place all large pattern pieces on fabric before starting to cut, cut smaller pieces later.
    c. cut each piece as it is needed.
    d. place all the pattern pieces on a double fold of cloth to save time in cutting.

23. Notches in the pattern should be indicated on the garment piece by:
    a. cutting in (into the seam allowance).
    b. cutting out (away from seam allowance).
    c. it makes no difference.

24. When cutting out the garment:
    a. cut on cutting line of pattern.
    b. allow 1/2 inch for seams.
    c. cut 1/4 inch from edge of pattern.

25. Staylining (Staystitching) is:
    a. marking the seam allowance on pattern pieces with machine stitching.
    b. stitching with the grain through a single thickness of fabric.
    c. making belt loops by hand.
    d. decorative stitching on the right side of garment.

26. Markings which are transferred from the pattern piece to the garment by using a tracing wheel should:
    a. show on the right side of the fabric.
    b. show on the wrong side of the fabric.
    c. show on both sides of the fabric.

27. When pinning on pattern pieces after they have been laid on the fabric:
    a. pin the corners of the pattern down first, then put pins along all edges.
    b. place the first pins on the arrow which indicates the grainline, then pin along edges of pattern.
    c. it makes no difference which part of the pattern is pinned first.

HOW WOULD YOU TAKE BODY MEASUREMENTS FOR A PATTERN?

28. The person who is <u>being measured</u> should:
    a. stand very straight with stomach flat.
    b. have arms straight at sides and feet together.
    c. stand with usual posture, comfortable.

29. The person <u>doing the measuring</u> should hold the tape measure:
    a. loose enough to allow for growth.
    b. snug, but not tight.
    c. tight, then add an inch to it.
    d. loose enough to allow for shrinkage.

30. The <u>hip</u> measurement should be taken:
    a. wherever the fullest part of the hip comes.
    b. in the middle of the hips.
    c. seven inches below the waist.
    d. lower in back than in front.

31. If a skirt pattern is 3 inches too short, the best method of lengthening is:
    a. put a 1 1/2 inch pleat in the material before laying the pattern on.
    b. cut the top part of the pattern, then move it down 3 inches and cut the remainder of the skirt.
    c. cut the pattern straight across, into 2 pieces and add a 3 inch piece of paper between.
    d. make the pattern longer at the waistline.

TO WHAT DOES EACH NUMBERED LINE REFER?

This diagram represents a piece of fabric. The broken lines indicate the design in the fabric. Select the phrase which best describes each <u>heavy</u> line.

32. Number 1 refers to:
    a. crosswise grain
    b. lengthwise grain
    c. garment bias
    d. true bias

33. Number 2 refers to:
    a. crosswise grain
    b. lengthwise grain
    c. garment bias
    d. true bias

34. Number 3 refers to:
    a. crosswise grain
    b. lengthwise grain
    c. garment bias
    d. true bias

35. Number 4 refers to:
    a. crosswise grain
    b. lengthwise grain
    c. garment bias
    d. true bias

CLOTHING CONSTRUCTION PRE-TEST

(Senior High)

This test is being given to determine the knowledge and skills you now have in sewing. It will not affect your grade in any way.

On the following pages are questions about sewing. Answer these questions on the answer sheet which accompanies this test. Choose the phrase which best completes the statement or answers the question, and mark (x) on the answer sheet beside the letter of this phrase. Be sure the number on the answer sheet is the same as the number of the test question.

There is no time limit, but do as many as you can in this one period. If you do not understand any part of the test, ask your teacher for help.

WHAT DOES A PATTERN MARKING MEAN?

Look at each diagram and select the answer which correctly identifies the marking on the pattern.

1. This marking is for:
   a. a notch
   b. a center front dart
   c. a bust dart
   d. an elbow dart

3. This marking means:
   a. it is the seam allowance
   b. place on fold of fabric
   c. leave open for placket between arrows
   d. a cutting line
   e. trim should be stitched here

2. This marking tells you to:
   a. tuck on this line
   b. fold on this line
   c. place on fold of fabric
   d. place on lengthwise grain
   e. place on crosswise grain

4. This marking shows:
   a. the natural waistline
   b. where to lengthen or shorten the pattern
   c. where to join the skirt and blouse
   d. where to attach the belt

5. Line 5 is:
   a. the center front
   b. the front fold
   c. a tuck
   d. a pleat

6. Line 6 is:
   a. the center front
   b. the front fold
   c. a tuck
   d. a pleat

WHAT ARE THE SIX PATTERN PIECES SHOWN ON THE OPPOSITE PAGE?

7. Pattern piece I is the:
   a. cuff
   b. yoke
   c. collar
   d. sleeve

8. Pattern piece II is the:
   a. front
   b. back
   c. sleeve

9. Pattern piece III is the:
   a. cuff
   b. yoke
   c. collar
   d. sleeve

10. Pattern piece IV is the:
    a. front
    b. back
    c. sleeve

11. Pattern piece V is the:
    a. front
    b. back
    c. sleeve

12. Pattern piece VI is the:
    a. cuff
    b. yoke
    c. collar
    d. sleeve

WHICH OF THE FOLLOWING EDGES SHOULD BE STITCHED TOGETHER?

13. On pattern piece I:
    a. stitch edge 27 to edge 24
    b. stitch edge 27 to edge 2
    c. stitch edge 27 to edge 25
    d. stitch edge 27 to edge 6

14. On pattern piece III:
    a. stitch edge 15 to edge 21
    b. stitch edge 15 to edge 4
    c. stitch edge 17 to edge 23
    d. stitch edge 16 to edge 3

15. On pattern piece V:
    a. stitch edge 8 to edges 16 and 22
    b. stitch edge 8 to edges 20 and 3
    c. stitch edge 8 to edges 20, 14, and 3
    d. stitch edge 8 to edge 24

16. On pattern piece VI:
    a. stitch edges 13 and 11 to edges 22 and 16
    b. stitch edges 10 and 12 to edges 22 and 16
    c. stitch edge 13 to edge 4
    d. stitch edge 11 to edge 6

WHICH ANSWER BEST COMPLETES EACH STATEMENT?

17. When cutting out a garment:
    a. cut 1/4 inch from edge of pattern to allow for growth.
    b. allow 1/2 inch for seams.
    c. cut on cutting line of pattern.
    d. leave 5/8 inch outside the cutting line for seams.

18. You have a piece of cotton fabric with uneven ends. Both ends were torn when it was taken from the bolt. How can it be straightened?
    a. stretch the fabric by pulling the short corner of each end.
    b. stretch the fabric by pulling one long corner of each end.
    c. pull a thread and trim the cloth evenly.
    d. press until fabric goes back into shape.

19. Staylining (staystitching) is:
    a. Marking the seam allowance on pattern pieces with machine stitching.
    b. Stitching with the grain through a single thickness of fabric.
    c. Decorative stitching on the outside of the garment.
    d. Stitching with the grain using contrasting thread.

20. A blouse pattern is 1 inch too long. What would be the best method for shortening the pattern?
    a. Folding a 1 inch pleat at the waistline.
    b. Folding a 1/2 inch pleat in the pattern between the armseye and waistline, keeping the underarm seamline straight.
    c. Folding a 1/2 inch pleat in the pattern between the armseye and waistline, keeping the lengthwise grainline straight.

21. If a skirt pattern is 3 inches too short, what is the best method of lengthening it?
    a. Use a tape measure and chalk and measure down 3 inches from the bottom of the pattern at several points, then connect these points with a line to get the new bottom edge.
    b. Put a 1 1/2 inch pleat in the material before laying the pattern on.
    c. Cut the top part of the pattern, then move it down 3 inches and cut the remainder of the skirt.
    d. Cut the pattern straight across, into 2 pieces and add a 3 inch piece of paper between.
    e. Make the pattern longer at the waistline.

22. When a gathered edge is stitched to an edge which is not gathered:
    a. Stitch with gathered side up.
    b. Stitch with gathered side on the bottom.
    c. Either way is all right.

23. To finish a facing down the front of a cotton blouse (shown by dotted line in drawing) so that it will not be conspicuous on the right side:
    a. Turn edge of facing under once and machine stitch, tack facing at the shoulder seams.
    b. Turn edge of facing under once and hand hem in place.
    c. Pink edge of facing and tack at the shoulder seams.
    d. None of these.

24. When buying a zipper for a dress placket, buy one that is:
    a. Closed at both ends.
    b. Closed at one end.
    c. Open at both ends.

25. Make button holes:
    a. As long as the button is wide.
    b. As long as the button is wide, plus the thickness of the button.
    c. 1/4 inch longer than the button width.

26. Staylining (staystitching) is important because it:
    a. Prevents raveling while making the garment.
    b. Prevents stretching while making the garment.
    c. Prevents the seams from raveling when garment is worn.
    d. Keeps the fabric from puckering while stitching the seams.

27. What will happen if a blouse is cut off grain?
    a. The pieces of the blouse will not fit together.
    b. The blouse pieces may stretch out of shape.
    c. It makes no difference.

HOW DO YOU PRESS OR IRON?

28. Which would be the better kind of heat to use on a wool fabric?
    a. High heat and no moisture.
    b. Moderate heat and moisture.
    c. High heat and moisture.

29. Mark (x) under P the results produced by pressing. Mark (x) under I the results by ironing. Both pressing and ironing may produce some of the results.

    a. Smooth the fabric
    b. Keep original texture of fabric
    c. Shrink out the fullness
    d. Keep the fabric grain lines
    e. Square up grain lines
    f. Develop luster

WHICH WOULD YOU DO FIRST?

In making a garment it is usually desirable to perform certain processes before others, but sometimes it does not matter which order is followed. In making a dress with a circular skirt, what processes should be done first?

30. a. Allow skirt to hang before marking for length.
    b. Mark skirt for length before allowing it to hang.
    c. It makes no difference.

31. a. Make buttonholes on blouse before stitching blouse to skirt.
    b. Stitch blouse to skirt before making buttonholes.
    c. It makes no difference.

32. a. Stitch the side seams together before putting in the bust darts.
    b. Stitch the bust darts before the side seams.
    c. it makes no difference.

TO WHAT DOES EACH NUMBERED LINE REFER?

This diagram represents a piece of fabric. The broken lines indicate the design in the fabric. Select the phrase which best describes each heavy line.

33. Number 1 refers to:
    a. crosswise grain
    b. lengthwise grain
    c. garment bias
    d. true bias

34. Number 4 refers to:
    a. crosswise grain
    b. lengthwise grain
    c. garment bias
    d. true bias

35. Number 2 refers to:
    a. crosswise grain
    b. lengthwise grain
    c. garment bias
    d. true bias

36. Number 3 refers to:
    a. crosswise grain
    b. lengthwise grain
    c. garment bias
    d. true bias

HOW WOULD YOU HEM THESE TWO GARMENTS

37. A cotton print dress with the pictured skirt:
    a. Turn raw edge under and stitch by machine, then blind stitch hem in place by hand.
    b. Stitch seam tape to cover raw edge, then blind stitch tape in place.
    c. Turn raw edge under and stich hem by machine.
    d. None of these methods.

38. A wool flannel dress with a skirt like the one pictured:
    a. Turn raw edge under and stitch by machine, then blind stitch hem in place by hand.
    b. Stitch seam tape to cover raw edge, then blind stitch tape in place.
    c. Stitch 1/2 inch from bottom edge, pink, then blind stitch hem.
    d. None of these methods.

S. H. 7

Double Thickness

Double thickness of fabric without nap

I

One thickness of fabric without nap

II

ARE THE PATTERN PIECES ON THE OPPOSITE PAGE PLACED CORRECTLY?

Below are several statements about the two pattern layouts on the opposite page. Mark Yes on answer sheet if statement is correct. Mark No if statement is not correct. A picture of the completed dress may be found on the opposite page.

39. In layout I both skirt pattern are correctly placed.
40. Layout I provides for a skirt of three pieces instead of only two as shown in the skirt pictured.
41. In layout I, the sleeve is placed on thr right grain.
42. In layout I the blouse front is correctly placed.
43. In layout II the skirt patterns are correctly placed.
44. Layout II provides for too many collars.
45. In layout II both sleeves are for the same arm.

HOW SHOULD YOU TRIM AND CLIP SEAMS?

46. The collar seam on a garment should be
    a. left as in Figure 1 above.
    b. notched as in Figure 2 above.
    c. slashed as in Figure 3 above.

HOW SHOULD MACHINE STITCHING LOOK IF THE TENSION IS GOOD? (see diagrams below for questions 47-49)

47. Figure 1 shows:
    a. good machine tension
    b. upper thread too tight
    c. lower thread too tight

48. Figure 2 shows:
    a. good machine tension
    b. upper thread too tight
    c. lower thread too tight

49. Figure 3 shows:
    a. good machine tension
    b. upper thread too tight
    c. lower thread too tight

*HOME ECONOMICS EDUCATION; *STUDENT EVALUATION; *FAMILY RELATIONSHIPS; *TEST CONSTRUCTION; *ACHIEVEMENT TESTS; PERSONAL ADJUSTMENT; TESTING; PROBLEM SOLVING; GRADE 10

Models for test items and evaluation devices are provided for adaption by home economics teachers to meet the needs of specific tenth grade family relations classes in the comprehensive high school. Evaluation materials were developed through research projects and trial use in Iowa schools by heterogeneous school groups. The materials are based on subject matter areas: developmental tasks, individual differences, family relationships, values, interests, and roles. Included are: (1) objectives to which the evaluation materials relate, (2) suggestions for introducing and interpreting the results of the tests, and (3) the problems, presented as capsulated experiences, illustrating generalizations which require the student to give not only the answer but also justification for the answer. Other evaluation materials for home economics areas, all using similar formats, are available as VT 005 746-VT 005 757 (ARM)Summer 1969). (FP)

INDEX TO GENERALIZATIONS AND TEST ITEMS FOR USE IN EVALUATING LEARNING IN FAMILY RELATIONS: 10th GRADE

A. Family practices result from differences in values.
   Test Item XII

B. As the culture changes, the family is affected and acts to make satisfactory adjustments.
   Test Item VI

C. What one person thinks is desirable and best is not necessarily what someone else thinks is desirable and best.
   Test Item II

D. Some conflict is normal in any close relationship.
   Test Items V, VIII

E. Decisions are more apt to be strongly supported when they are arrived at through the participation of group members to the extent that their maturity allows.
   Test Items III, XI

F. In order to become a more mature person, one must work toward being accepted by others.
   Test Item IX

G. Being friendly is a complex skill which we can all learn.
   Test Item IV

H. The social group of which you are a part influences not only what you do, but also your ideas.
   Test Item X

I. If we are wise, we accept other people's decisions until we can or are able to make adequate decisions for ourselves.
   Test Item XIII

J. While conflicts cannot be eliminated, they can be controlled and handled more smoothly and harmoniously if both parents and children are aware of each other's point of view.
   Test Item I

K. Being able to use good judgment in the selection of our friends is a part of growing up.
   Test Item VII

OBJECTIVES AND DEVELOPMENT AND USE OF TEST ITEMS

I. Objectives: These evaluation materials relate to the following objectives

1. To recognize sequence and variations within normal adolescent development.
2. To understand and accept individual differences in people.
3. To recognize their own motives and develop a sense of values that will aid growth toward maturity.
4. To acquire sensitivity to the problems of themselves and other people.
5. To recognize that families are different and expect each of their families to do some things differently than other families do them.
6. To contribute to the growth of others.
7. To recognize the satisfactions from relationships with siblings.
8. To recognize reasons why people have different interests and points of view.
9. To determine and fulfill one's role in the family.

II. Development of Test Items: The items in this packet are based on the above objectives and the generalizations given at the top of the page containing a test item. The solutions and reasons for the problems include misconceptions collected from Iowa pupils.

III. Selection of items to combine into a test: Choose the items which involve the generalizations on which you wish to determine where your pupils are at any stage of learning (pre-test, during unit, at the end of unit, or as a part of semester test).

IV. Provision of a setting and directions: Here are a few suggestions which might be used with family relations tests.

Getting Along

Do you ever say to yourself Why did he do that? Why did she say that? What would I do if I were in that situation?

We all want to get along successfully with other people (children, friends, teachers, parents, etc.). As we know what makes others act and feel as they do, we are better able to get along with them.

Several situations are described in the following pages. After studying each carefully, check (x) the answer(s) you think <u>best</u> and the reason(s) <u>why</u> you have selected the answer(s).

In order to force pupils to consider each solution and/or reason, do not indicate the number of statements they are to check.

V. Scoring the test: To obtain a score for each girl check and total <u>only</u> the correct solutions and/or reasons. (See key on mimeographed copy of each item). It is better <u>not</u> to make deductions for incorrect choices because some of the problems are of such a nature that some of the reasons could conceivably be true under certain circumstances. The key provides for determining only those which make use of the particular generalization(s) listed at the top of each page. Also research on these items indicates that deducting for guessing has little effect on the relative size of the scores unless a student checks an unreasonably large number of responses.

VI. Interpreting the results of the test: The results can be looked at several ways to determine how well your pupils can apply the generalizations involved in the test.

(1) The size of the scores in relation to the total possible score gives a general idea of the class as a whole. Individual scores indicate which pupils have achieved most and which need more experiences. A look at the responses of individual pupils, particularly those whose scores are low, will indicate places where special help is needed.

(2) If the test has been given before and also after the unit has been taught, you can see the extent of progress, provided the particular problems have not been discussed in class.

(3) Tabulating the total number of pupils who selected each solution and reason gives you clues to needs for learning, whether the test is used as a pre-test or after some instruction. Noting the generalizations which they failed to apply and the misconceptions (incorrect responses), you have a basis for planning experiences. Below is an illustration of an item that was administered to 119 tenth-grade pupils.

Mabel, 15, and Hazel, 16, are sisters and both are in the tenth grade. They are friends of Elsie, who is a very popular member of their class. Usually the three girls go to the movies on Wednesday afternoons after school, but yesterday Mabel and Elsie dodged Hazel and went to the movie. Hazel has refused to talk to Mabel since the incident and their mother is alarmed. Although the girls have argued, they have never before stopped speaking to each other.

Do you think there is reason for alarm on the part of the mother? Check (x) the answer you think <u>better</u>.

45 A. Yes
X 74 B. No

Check (x) the reason or reasons for choosing your answer.

33 1. The problem should be solved before it gets worse.
X 62 2. Sisters frequently have disagreements because they are together so often.
15 3. Hazel needs help to overcome her jealousy.
24 4. The whole family will be affected by their actions, if they are allowed to continue.
45 5. Jealousy is a trait of teenage girls which they overcome as they become older.
6 6. The sisters are stubborn.

Although almost two-thirds of these pupils checked the correct solution (B), fewer were able to apply the generalization when they selected a reason (2): Some conflict is normal in any close relationship. Many see it as a serious problem (1) or attribute it to jealousy (3 and 5). More than half need help in understanding the generalization.

Generalization D: Some conflict is normal in any close relationship.

V. Mabel, 15, and Hazel, 16, are sisters and both are in the tenth grade. They are friends of Elsie, who is a very popular member of their class. Usually the three girls go to the movies on Wednesday afternoons after school, but yesterday Mabel and Elsie dodged Hazel and went to the movie without her. Hazel has refused to talk to Mabel since the incident and their mother is alarmed. Although the girls have argued, they have never before stopped speaking to each other.

Do you think there is reason for alarm on the part of the mother?

Check with an x the answer you think better.

_____A. Yes
__x__B. No

Check with an x the reason or reasons for choosing your answer.

_____1. The problem should be solved before it gets worse.
__x__2. Sisters frequently have disagreements because they are together so often.
_____3. Hazel needs help to overcome her jealousy.
_____4. The whole family will be affected by their actions, if they are allowed to continue.
_____5. Jealousy is a trait of teen-age girls which they will overcome as they become older.
_____6. The sisters are stubborn.

Generalization E: Decisions are more apt to be strongly supported when they are arrived at through the participation of group members to the extent that their maturity allows.

III. Mr. Johnson has asked all members of the family to stay home Thursday evening to help decide what kind and color of new car to purchase. Sam and Sylvia (14 and 16) said they had something else planned. Mr. Johnson urged them to be with the family group.

Why do you think Mr. Johnson wanted Sam and Sylvia to help with the decisions?

Check with an x the answer or answers you think <u>best.</u>

_____1. They would learn to cooperate.
_____2. Mr. Johnson was an unselfish person and wanted everyone's idea.
_____3. This would make the family feel closer.
_____4. It's nice to have a family together once in a while.
_____5. The children would learn how to make decisions.
_____6. The children will feel as if they have some responsibility.
__x__7. Everyone is more likely to be satisfied if each helps make decisions.

Generalization A: Family practices result from differences in values.

XII. Bertha Anderson, 16, visited a cousin for the week-end. When she returned home she told her mother that the cousins had a beautiful home and they had just purchased a television set, instead of having running water put in their home. The Anderson home is comfortable and not as pretty as that of the cousins, but it has running water. Both families live on a farm and have about the same amount of money.

Which family is spending its money more wisely?

Check with an x the answer you think best.

_____A. Anderson family
_____B. Cousins's family
__x__C. Both families

Check with an x the reason or reasons which explain your answer.

_____1. Beautiful surroundings help to make life more interesting.
_____2. People need running water before they need television.
_____3. Pleasure is important for every family.
__x__4. Families have different ideas of the things they want.
_____5. It is important for families to consider what other people think about what they have in their houses.

Generalization G: Being friendly is a complex skill which we can all learn.

IV. Joseph, 15, needed a date for the class party because all of the other fellows had dates. He had not been friendly with girls very much before and because of this had difficulty getting a date for the party. Several of the fellows in Joseph's class decided to help him with this problem.

Do you think Joseph's friends were right in wanting to help him learn how to be more friendly with girls?

Check with an x the answer you think better.

__x__ A. Yes
_____ B. No

Check the reason or reasons for choosing your answer.

_____ 1. He would be missing a lot without dates.
_____ 2. Because everyone else had a date is no sign Joseph needed one.
_____ 3. He can't always depend on friends to get a date and should help himself.
_____ 4. If Joseph doesn't like girls he might as well stay home.
_____ 5. Joseph is only fifteen and has lots of time to be interested in girls.
_____ 6. He should be acquainted with members of the opposite sex because he later will have to choose a mate.
__x__ 7. Everyone can learn to be friendlier.

Generalization H: The social group of which you are a part, influences not only what you do, but also your ideas.

X. Beverly, age 18, asked Pat, 17, to go with her group to the next town to attend a basketball game. Beverly's group kept very late hours. Pat asked her mother if she should go, but her mother encouraged her to make her own decisions. Pat thought it over and decided to go to a show with her own friends instead.

Why do you think Pat turned down Beverly's invitation?

Check with an x the answer or answers you think <u>best</u>.

_____1. Pat didn't want to be talked about.
_____2. She realized that she would have felt out of place because Beverly's friends were older.
_____3. Her mother trusted her and she wanted to keep her own friends.
_____4. Pat knew that she would have more fun with her own friends.
__x__5. Pat realized that this group might influence her ideas of how to act.
_____6. Pat was afraid she might lose her friends.

Generalization I: If we are wise, we accept other people's decisions until we can or are able to make adequate decisions for ourselves.

XIII. Sandra, age 16, told her parents that she thought she was old enough to make most of her own decisions. Several nights later when Sandra went out with friends, her parents did not tell her what time to return home, but agreed that she would make the decision. It was very late when Sandra arrived home. The next morning her parents told her that she would not be allowed to make this decision again for a while.

How do you think Sandra should have felt about her parents' choice of a solution to this problem?

Check with an x the answer or answers you think <u>best</u> explain Sandra's feelings.

_____A. Have expected her parents not to let her make this decision for a while
_____B. Have felt her parents were wrong
_____C. Been ashamed that she did not make a better decision
__x__D. Have felt her parents were wise
_____E. Be glad her parents cared what she did
_____F. Have felt her parents were too hasty

Check with an x the reason or reasons for choosing your answer or answers.

_____1. She is too young to know what is best for her.
__x__2. She proved that she was not yet mature enough to make this decision.
_____3. She has to learn responsibility.
_____4. A girl sixteen is old enough to make her own decisions.
_____5. She took advantage of her parents' decision to let her make a choice.

Generalization J: While conflicts cannot be eliminated, they can be controlled and handled more smoothly and harmoniously if both parents and children are aware of each other's point of view.

I. Judy, 16, and Marcia, 17, are friends and are together frequently. Recently, however, Judy has noticed that her parents seemed to disapprove of Marcia although they haven't said anything about them being together. Judy decided to ask her parents how they really felt about Marcia and why. She also decided to tell them why she likes Marcia.

Do you think Judy made a wise decision?

Check with an x the answer you think better.

x* A. Yes
_____ B. No

Check with an x the reason or reasons for choosing your answer.

_____ 1. Judy has a right to know her parent's reasons for their actions.
_____ 2. Judy may be able to help Marcia if she knows why her parents disapprove of her.
_____ 3. Teen-agers should be able to choose friends without parents interfering.
x* 4. Disagreements often can be worked out if family members know how the other feels about things.
_____ 5. Judy would have a chance to prove to her parents that Marcia was all right.
_____ 6. Judy is old enough to have the responsibility of choosing her own friends.

*x indicates best response for this generalization

Generalization E: Decisions are more apt to be strongly supported when they are arrived at through the participation of group members to the extent that their maturity allows.

XI. There is a quarrel almost every evening at the Taylor's. The two boys, Bob (age 12) and John (age 10) want to hear one TV program at 7 P.M.; Martha (age 16) wants a different program. Their mother thinks that the children should work out a plan so each can see a program he likes some evenings. Martha says that since she is the oldest of the three children, she should make the plan.

Whom do you think should make the plan?

Check with an x whom you think should make the plan.

_____A. Martha
_____B. The parents
__x__C. The three children
_____D. The parents and the three children

Check with an x the reason or reasons which <u>best</u> explain your answer.

_____1. After all, the parents bought the TV set.
_____2. Martha has had more experience in making plans.
_____3. Martha needs to learn that she can't have her own way all the time.
* x 4. They will be more satisfied with the plan.
_____5. The younger ones in a family are just as important as the older ones.
_____6. The plan probably would be more fair.
_____7. The brothers are capable of helping to make the plan.
_____8. As you get older your interests are more important.
* x 9. The plan will be followed better.

---

*Flexible Key 4 or 9

Generalization C: What one person thinks is desirable and best is not necessarily what someone else thinks is desirable and best.

II. Jani, 16, was chairman of the committee which was to make suggestions to the "Teen Club" on places to hold the annual dance. She failed to call a committee meeting so instead she picked out the places she believed were best and made her report. She thought that it shouldn't make much difference to the others anyway.

Was Jani right?

Check with an x the answer you think better.

__x__ A. No
____ B. Yes

Check with an x the reason or reasons for choosing your answer.

____ 1. Jani probably knew the places they all liked to go.
____ 2. She will lose friends by taking things in her own hands.
__x__ 3. Others may have ideas which differ from hers.
____ 4. Since Jani was chairman, she was going to give suggestions anyway.
____ 5. Jani will get a reputation for wanting to do everything herself and others will not want to be on committees with her.

Generalization B: As the culture changes the family is affected and acts to make satisfactory adjustments.

VI. Rita's aunt was visiting with them for a few days. On the second day of her visit, Rita, who is sixteen, went to the movies with Roger, 18. She was told to be home by 10:30. Rita's aunt said that she was shocked at Rita's parents for letting her run around and stay out like that, because Rita's mother and she certainly hadn't grown up that way.

What reason might account for the difference in the two families?

Check with an x the reason or reasons you think best.

_____1. Rita's mother understands teen-agers better.
_____2. When Rita's aunt was that age, there were not as many places to go.
_____3. Rita's mother wants her to be able to do things she wasn't allowed to do when she was that age.
__x__4. Rita is living in a different age and family living has changed.
_____5. Some older people seem to forget how things really were when they were young.
_____6. One family was much stricter than the other.

Generalization K: Being able to use good judgment in the selection of our friends is a part of growing up.

VII. Marian, 16, told her mother that she was bringing a new friend home from school the next day. "She is a very nice girl and I'm sure you'll like her," said Marian. Mrs. Taylor wondered what the new friend would be like since Marian had often chosen friends very poorly. The next afternoon when Mrs. Taylor met Marian's friend she felt that Marian had used good judgment.

What might explain Marian's increased ability in selecting a friend?

Check with an x the answer or answers you think best.

_____1. Marian realized she needed to choose friends carefully since she'd soon be choosing them for a lifetime.
_____2. She chose more carefully because she wanted the approval of her mother.
__x__3. She was older and more mature in her thinking.
_____4. Marian realized her name wouldn't be very good if she kept choosing poor friends.
_____5. She chose more carefully because of former criticism.

Generalization D: Some conflict is normal in any close relationship.

VIII. Ruby, 16, saw a very pretty off-the-shoulder dress in the window of one of the department stores, as she was coming home from school. She decided that she would ask her mother for the dress. Upon arriving home she found that her mother had just returned from shopping. Ruby described the dress and asked her mother if she had seen it. Her mother said, "Yes, I saw it and I think that it is very pretty, but it's much too old for you." Ruby resented this and wasn't very happy all evening. Her father noticed it and asked her what the trouble was. When she explained what had happened, he said, "But you two are never supposed to argue."

Do you think Ruby's father should have expected Ruby and her mother never to have serious arguments?

Check with an x the answer you think <u>better</u>.

_____A. Yes
__x__B. No

Check with an x the reason or reasons for choosing your answer.

_____1. Teen-agers are inclined to argue.
_____2. Disagreements don't get you anywhere.
_____3. Her mother probably knows best and Ruby shouldn't argue with her.
__x__4. When people spend a lot of time together, they are likely to disagree some of the time.
_____5. They must learn to agree.
_____6. Ruby should have more respect for her mother than to argue with her.

Generalization F: In order to become a more mature person, one must work toward being accepted by others.

IX. Edith, a tenth-grade student, is very shy and has little confidence in her ability to do things well. She never volunteers to take part in any classroom activities, but makes high marks on her tests and individual projects. Edith seldom attends school parties or other social affairs. Velma, Edith's friend, thinks Edith acts more as an eighth-grade student than as a tenth-grade one.

Can Edith become more like a tenth-grader?

Check with an x the answer or answers you think best.

__x__ 1. Yes, if she works toward being more friendly with others.
____ 2. No, her nature is to be shy.
____ 3. Yes, if she would gain more confidence in herself.
____ 4. No, it is too late to change her disposition.
____ 5. Yes, if other people would make her join in activities more.

OBJECTIVES AND DEVELOPMENT AND USE OF TEST ITEMS

I. Objectives: These evaluation materials relate to the following objectives

1. To recognize sequence and variations within normal adolescent development.
2. To understand and accept individual differences in people.
3. To recognize their own motives and develop a sense of values that will aid growth toward maturity.
4. To acquire sensitivity to the problems of themselves and other people.
5. To recognize that families are different and expect each of their families to do some things differently than other families do them.
6. To contribute to the growth of others.
7. To recognize the satisfactions from relationships with siblings.
8. To recognize reasons why people have different interests and points of view.
9. To determine and fulfill one's role in the family.

II. Development of Test Items: The items in this packet are based on the above objectives and the generalizations given at the top of the page containing a test item. The solutions and reasons for the problems include misconceptions collected from Iowa pupils.

III. Selection of items to combine into a test: Choose the items which involve the generalizations on which you wish to determine where your pupils are at any stage of learning (pre-test, during unit, at the end of unit, or as a part of semester test).

IV. Provision of a setting and directions: Here are a few suggestions which might be used with family relations tests.

Getting Along

Do you ever say to yourself Why did he do that? Why did she say that? What would I do if I were in that situation?

We all want to get along successfully with other people (children, friends, teachers, parents, etc.). As we know what makes others act and feel as they do, we are better able to get along with them.

Several situations are described in the following pages. After studying each carefully, check (x) the answer(s) you think <u>best</u> and the reason(s) <u>why</u> you have selected the answer(s).

In order to force pupils to consider each solution and/or reason, do <u>not</u> indicate the number of statements they are to check.

V. Scoring the test: To obtain a score for each girl check and total <u>only</u> the correct solutions and/or reasons. (See key on mimeographed copy of each item). It is better <u>not</u> to make deductions for incorrect choices because some of the problems are of such a nature that some of the reasons could conceivably be true under certain circumstances. The key provides for determining only those which make use of the particular generalization(s) listed at the top of each page. Also research on these items indicates that deducting for guessing has little effect on the relative size of the scores unless a student checks an unreasonably large number of responses.

VI. Interpreting the results of the test: The results can be looked at several ways to determine how well your pupils can apply the generalizations involved in the test.

(1) The size of the scores in relation to the total possible score gives a general idea of the class as a whole. Individual scores indicate which pupils have achieved most and which need more experiences. A look at the responses of individual pupils, particularly those whose scores are low, will indicate places where special help is needed.

(2) If the test has been given before and also after the unit has been taught you can see the extent of progress, provided the particular problems have not been discussed in class.

(3) Tabulating the total number of pupils who selected each solution and reason gives you clues to needs for learning, whether the test is used as a pre-test or after some instruction. Noting the generalizations which they failed to apply and the misconceptions (incorrect responses), you have a bases for planning experiences. Below is an illustration of an item that was administered to 119 tenth-grade pupils.

Mabel, 15, and Hazel, 16, are sisters and both are in the tenth grade. They are friends of Elsie, who is a very popular member of their class. Usually the three girls go to the movies on Wednesday afternoons after school, but yesterday Mabel and Elsie dodged Hazel and went to the movie. Hazel has refused to talk to Mabel since the incident and their mother is alarmed. Although the girls have argued, they have never before stopped speaking to each other.

Do you think there is reason for alarm on the part of the mother? Check (x) the answer you think <u>better</u>.

45 A. Yes
x 74 B. No

Check (x) the reason or reasons for choosing your answer.

33 1. The problem should be solved before it gets worse.
x 62 2. Sisters frequently have disagreements because they are together so often.
15 3. Hazel needs help to overcome her jealousy.
24 4. The whole family will be affected by their actions, if they are allowed to continue.
45 5. Jealousy is a trait of teenage girls which they overcome as they become older.
6 6. The sisters are stubborn.

Although almost two-thirds of these pupils checked the correct solution (B), fewer were able to apply the generalization when they selected a reason (2): Some conflict is normal in any close relationship. Many see it as a serious problem (1) or attribute it to jealousy (3 and 5). More than half need help in understanding the generalization.

(Suggestions to Teachers)

SONGS WE SING

You may find this device helpful in learning some of the ideals for family living which the pupils have. These will help you in planning part of the unit in family relations. It is very important for pupils to be frank, so you may need to tell them not to sign their names.

The following statements taken from papers written by twelfth-grade pupils in a preliminary trial of this device indicate the ideas which they held:

1. "We'll find perfect peace where joys never cease and let the rest of the world go by."
   a) "You can't expect to attain perfect peace in marriage."
   b) "Without social contact with others you become self-centered and life is apt to be boring."

2. "Through the years, I'll take my place beside you."
   a) "You are supposed to share the troubles, grief, happiness and joys."
   b) "Beside your husband you can help and work things out together."

3. "I want a diamond ring, bracelets. . . everything."
   a) "These things don't make a happy marriage."
   b) "A marriage should be filled with love and happiness, not jewels and money."
   c) "This is certainly a selfish attitude to take."

4. "A home is our castle where all our treasures are stored."
   a) "This is an excellent description. Our treasures will be the children and the love we have for each other."
   b) "A home will be a castle in a matter of speaking. It will be peaceful, have as nice things as the family can afford and above all, have happiness and love."

Note that in this last statement there is a failure to indicate that all will not be peaceful and happy. This pupil may need to be helped to see that some conflict is inevitable and desirable in families; that one should not expect peace at all times.

If you find this device useful, you could prepare others similar to it, using excerpts from different songs in effort to learn other ideas which the pupils have.

SONGS WE SING

Song writers often express sentiments about marriage. Parts of four songs are listed below. Read each one and then in the space beneath write down whether the song agrees with your idea of marriage.

1. "We'll find perfect peace where joys never cease and let the rest of the world go by."

2. "Through the years, I'll take my place beside you."

3. "I want a diamond ring, bracelets, -- everything."

4. "A home is our castle where all our treasures are stored."

INDEX TO GENERALIZATIONS AND ITEMS FOR EVALUATION
IN FAMILY RELATIONS: 11 and/or 12TH GRADES

A. The way a family uses its resources depends upon what the family believes is important, even though they don't know or recognize the fact.
Test Item V

B. There are many ways of keeping the avenues of communication open.
Test Item II

C. The quality of relationships is more important than the quantity.
Test Item I

D. Family practices result from differences in cultural heritages.
Test Item III

E. Some conflict is normal in any close relationship.
Test Item X

F. Each individual can make a contribution to activities of a group.
Test Item VII

G. The people with whom we work and play prefer us to "let off steam" in socially acceptable ways and in appropriate places.
Test Item IX

H. A mature person accepts himself, recognizing his potentialities and his limitations.
Test Item VI

I. The attitudes of those with whom a person associates affect the way he feels about himself.
Test Items IV, VII

J. Girls in most cases mature earlier than boys.
Test Item XII

K. Skills in developmental tasks are related to readiness (previous learning and present opportunities).
Test Item VIII

L. Individuals differ in rate of growth.
Test Item XV

M. Problems can be worked out better if you understand how others feel.
Test Item I

N. Parents as well as adolescents have cultural pressures.
Test Item XI

O. An adequate home acts as a sounding board for feelings--where each family member can "get things off his chest" and still be accepted.
Test Item XIV

P. Parents cannot do the whole job of helping children grow to maturity; communities must help.
Test Item XI

Generalization C: The quality of relationships is more important than the quantity.

I. Mr. and Mrs. Fisher have five children ranging in age from eight to sixteen. Thurdsay night has always been "family fun" night for them. Now James, 12, has a Boy Scout meeting on Thursday night which is the only free night in the week when the other members of the family can get together. Mr. Fisher said, "James knew this was the night we got together before he started going to Boy Scout meetings, so we'll go on without him."

The Harris family had a problem similar to that of the Fishers. However, they have done away with "family fun" night but try to do things together as often as they can. Sometimes the older children come into their parent's room at bedtime so that they can talk over the day's happenings. Mrs. Harris often packs picnic dinners and, when the family comes home in the evening, they ride out and find a pretty spot to eat.

Which family do you think has the better plan?

Check with an x the answer which you think <u>better</u>.

___A. Fisher family
x* B. Harris family

Check with an x the reason or reasons which explain your answer.

___1. The plan used by the Harris family doesn't leave anyone out.
___2. It is more interesting to do different things at different times.
___3. Every family should have a "family fun" night.
___4. As children grow older they need to break family ties a little.
___5. The smaller children need to have fun just as much as the older ones.
___6. James may draw away from his family and get into trouble.
x* 7. It's more important how much a family enjoys getting together than how often they get together.

x* indicates best responses for this generalization

Generalization B: There are many ways of keeping the avenues of communication open.
M: Problems can be worked out better if you understand how others feel.

II. Mr. and Mrs. Evans and Donald, age 14, have usually talked over the day's events during dinner. Recently, Donald has not joined in the conversations and, if he is asked what happened at school, he doesn't answer or he says, "Nothing" or "Gosh, why do you want to know?"

What should Donald's family do about his not joining the conversations?

Check with an x the answer you think best.

___A. Try to get him to join in the conversations.
*x B. Find out why he doesn't join in.
*x C. Let him alone.

Check with an x the reason or reasons which explain your answer.

____1. Every family member should take an active part in the activities.
____2. Donald may feel neglected.
**x 3. He probably needs help with some problems.
**x 4. He may be at a stage where he wants to keep things to himself.
**x 5. You don't have to tell everything that happens to be a good member of a family.
**x 6. His family may be able to help if they know how he feels.

---

* Flexible Key B or C
** Flexible Key 3 and 6 or 4 and 5

Generalization D: Family practices result from differences in cultural heritages.

III. Christine is going steady with Jack. She wants to invite him over for Christmas dinner, knowing that they will be having lutfisk (a Swedish fish) as they always do. She is afraid that Jack will think they are queer celebrating Christmas as her parents did in Sweden.

Do you think Christine should invite Jack?

Check with an x the answer you think <u>better</u>.

_x_ A. Yes
____ B. No

Check with an x the reason or reasons which explain your answer.

____ 1. Jack might not like lutfisk since it is such a strong-flavored fish so he wouldn't enjoy the dinner.
_x_ 2. He should be able to understand that families have different customs depending on their background.
____ 3. Christine should not be ashamed of things her family does.
____ 4. He might think her family did odd things.
____ 5. He might enjoy celebrating Christmas a different way.

Generalization I: The attitudes of those with whom a person associates affect the way he feels about himself.

IV. Dan, 16, was much slower doing his work than many others in his classes. Because he usually got poor marks, he was sure that he was dumb. Recently, Mrs. Edwards, his teacher, discovered that he was very good in art and suggested that he help design the costumes for the Shakespearean play the English class was presenting. Dan's classmates began to think differently about his ability when they saw his costume designs.

How do you think Dan felt after he began to do well in art?

Check with an x the answer or answers which you think <u>best</u> explain how he felt.

____A. More friendly toward his classmates
____B. Conceited
_x_C. More sure of himself
____D. More like the others in his class

Check with an x the reason or reasons for your answer or answers.

_x_1. His classmates thought more of him.
____2. He proved he could do something well.
____3. He knew he was useful.
____4. Suddenly getting a lot of attention sometimes makes a person think he can do anything.

Generalization A: The way a family uses its resources depends upon what the family believes is important, even though they don't know or recognize the fact.

V. Mr. Beck and Mr. Brown both work as tinsmiths at the local railroad shops and each have received a $200 bonus. Neither family has a TV set. Both families have a washing machine that is not automatic. Mr. Beck took his bonus and bought a TV set, while Mr. Brown bought an automatic washing machine. Each family has four children from 6 to 15 years of age.

Why do you think they spent their money for different things?

Check with an x the reason or reasons you think <u>best</u> explain why these men spent their bonus money differently?

____1. Mr. Beck thought entertainment was more important than Mr. Brown did.
____2. Mr. Beck wanted his children to have what other children have.
____3. Mr. Brown was more considerate of his wife than Mr. Beck.
_x_4. Families have different interests and desires.

Generalization H: A mature person accepts himself, recognizing his potentialities and his limitations.

VI. Paul and Floyd attend a high school which goes "all out" for basketball. They both love basketball but are too short to be on the team. Paul spends a great deal of his time with the team, however, and the coach has decided to make him a student manager. Floyd resents not being able to play and sits on the side of the visiting team at games and sometimes routs against his school.

What might explain the difference in Paul's and Floyd's behavior?

Check with an x the reason or reasons which <u>best</u> explain why Paul and Floyd act differently.

____1. Floyd is spoiled.
____2. Paul has more school spirit.
____3. Their home life and the attitude of their parents could be different.
* x 4. Paul is more like a man and accepts things as they are.
____5. Floyd is thinking too much of himself and not of the team.
____6. Floyd is the type who gives up before trying.
* x 7. Floyd has not yet learned to accept things he can't help.
____8. Paul is not so selfish.

* Flexible Key 4 or 7

Generalization F: Each individual can make a contribution to the activities of a group.

I: Attitudes of those with whom a person associates affect the way he feels about himself.

VII. Charlotte, 17, was chairman of the program committee for the senior class assembly program.. When she presented the program to the class for their approval, Mrs. Anderson, class adviser, noticed that Jacqueline was the only student not contributing to the program. After the meeting, Mrs. Anderson asked Charlotte about the omission. Charlotte said, "The program is to be dramatized and Jacqueline has little dramatic ability."

Do you think the plans should be changed so Jacqueline can contribute?

Check with an x the answer you think <u>better</u>.

____A. No.
_x_B. Yes

Check with an x the reason or reasons for choosing your answer.

____1. All members of a class should participate in a class assembly.
____2. If Jacqueline is broad-minded, she can adjust to this situation.
_x_3. Jacqueline may feel that she can do nothing well, if she is left out.
_x_4. A whole program shouldn't be changed for one person.
____5. Jacqueline can be included by allowing her to use some other abilities she has.
____6. It is not fair to leave one person out.

Generalization K: Skills in developmental tasks are related to readiness (previous learning and present opportunities).

VIII. Juanita, 16, is very pretty and the boys at school want dates with her. She prefers not to date but to go to the movies or "Teen Center" with some of her girl friends on their dateless nights.

What might explain why Juanita was not interested in dating?

Check with an x the reason or reasons which <u>best</u> explain Juanita's lack of interest.

____1. She may be shy and doesn't want the boys to know it.
_x_2. She may not be interested in boys yet.
____3. She may like to get good grades and knows that dating will interfere.
____4. She may not know how to act with a boy.
____5. She may be "stuck up."
____6. It may be that she has had an unpleasant experience with a boy.

Generalization G: The people with whom we work and play prefer us to "let off steam" in socially acceptable ways and in appropriate places.

IX. In play practice, when Miss Taylor told John to come on stage through a different door and to say his lines differently, John pounded the table causing a vase to fall off and break. Miss Taylor said she didn't care if he showed his anger, but he should be more careful of other people's property.

What was Miss Taylor trying to help John do after he broke the vase?

Check with an x the reason or reasons which you think best explain what she was trying to do.

____1. Calm him down.
____2. Make him feel sorry for what he did.
____3. Be more thoughtful of other people.
____4. Help him learn to control his temper.
____5. Let him know that he wasn't bothering her by losing his temper.
*x 6. Tell him there are ways of letting off steam that are all right.
____7. Make him ashamed of himself.
____8. Teach him to respect others' property.
*x 9. Let him know there are good and poor ways to show his feelings.

* Flexible Key 6 or 9

Generalization E: Some conflict is normal in any close relationship.

X. Vera, 19, and Raymond, 20, have gone steady for several years and plan to be married soon. Vera came home quite upset several nights ago, however, because they had a misunderstanding. It was their first serious disagreement and Vera thinks that they don't understand each other very well. She has decided that they should wait a while longer before marrying to be sure that all matters on which they disagree can be worked out so they won't have any serious disagreements after they marry.

Do you agree with Vera's decision?

Check with an x the answer you think <u>better</u>.

_x_ A. No
____ B. Yes

Check with an x the reason or reasons for choosing your answer.

____ 1. Vera has to live with him and she doesn't enjoy disagreements.
____ 2. Disagreements should be worked out before marriage or they may lead to unhappiness and a broken home.
_x_ 3. It's natural to disagree at times with someone you spend a lot of time with.
____ 4. This disagreement could lead Vera to find out a lot about Raymond that she doesn't know.
____ 5. If they love each other, one misunderstanding won't matter.
____ 6. They need time to see if they will have any more misunderstandings.

Generalization N: Parents as well as adolescents have cultural pressures.

XI. One of Mr. Miller's neighbors told him that his daughter, Helen, 15, had been seen talking to Tom Evans, who has just returned from the boys' reformatory. Mr. Miller discussed this with Helen and told her that he'd rather she didn't talk to Tom again.

Why do you think Mr. Miller suggested that Helen stop talking to Tom?

Check with an x the answer or answers you think <u>best</u>.

____1. Tom might be a bad influence on Helen.
____2. Girls need to be guided to keep the right kind of acquaintances.
____3. Tom was not the right kind of guy to talk to.
____4. Helen is a bit young to be talking to a fellow with such a background as Tom has.
_x_5. Since Tom has not yet been accepted by the community, people would criticize the Millers.

Generalization J: Girls in most cases mature earlier than boys.

XII. Cynthia was in the seventh grade Home Economics class when the teacher brought up the idea of inviting the seventh grade Industrial Arts class to a party the next day, when they would be baking cookies and making lemonade. Cynthia said, "Oh, those boys won't know how to act and they'll be so silly." The teacher said, "We could have the party so well planned that they will be sure to know how to act." "Well," said Cynthia, "I'd just as soon have the party without those boys."

What might have caused Cynthia to act as she did?

Check with an x the answer or answers you think best.

_x_1. Cynthia is more mature than the boys in her class.
____2. She may not be able to get along with boys.
____3. Cynthis has formed an opinion of all boys from having associated with a few who didn't know how to act.
____4. She is bashful and shy around boys.
____5. Cynthia is not used to being around boys.
____6. She is just spoiled and usually gets her way.
____7. She thought the boys would pay more attention to some of the other girls than to her.

Generalization P: Parents cannot do the whole job of helping children grow to maturity; communities must help.

XIII. In the town of Friend, with a population of 10,000, a gang of boys comes to the recreation center every night and "beats up" one or two boys who are there. The fights always take place outside the recreation center so the chaperones of the center have no control over them. Some people feel that the community should take action.

What do you think should be done?

Check with an x the answer or answers you think best.

____A. The parents of the gang should be responsible for what their children are doing.
_x_B. The community should take some responsibility for these boys.
____C. Both groups of boys should get together and find out what is causing the fights.

Check with an x the reason or reasons which best explains your answers.

____1. The community has no control over other people's children.
____2. Parents should take care of making their children behave.
____3. The recreation center will get a bad reputation.
____4. The boys in the gang could become criminals.
____5. Boys understand each other better than older people do.
_x_6. Parents need help from the community in raising their children.

Generalization O: An adequate home acts as a sounding board for feelings--where each family member can "get things off his chest" and still be accepted.

XIV. Mrs. Martin told four-year-old Janice that she couldn't go outside without her boots because it was muddy. Janice said, "I don't like you." This is always her response whenever she can't do as she wishes.

Should Janice's mother let her say this?

Check with an x the answer you think better.

_x_ A. Yes
____ B. No

Check with an x the reason or reasons which explain your answer.

____ 1. Children think more of their parents, if they are made to do as they are told.
____ 2. Janice needs to learn right from wrong.
____ 3. If she is ignored, she will soon stop because she is doing it to get attention.
____ 4. She will say this to other people and they will not like her.
____ 5. She will grow out of it, if her mother doesn't pay any attention to her saying this.
_x_ 6. It is better to let children express their feelings at home.
____ 7. Janice is going through a stage that most four-year-olds go through.
____ 8. She will have a hard time breaking this habit, if it isn't broken soon.

Generalization L: Individuals differ in rate of growth.

XV. Jim and Bill attended the Junior-Senior Prom, but did not bring dates. Most of the fellows went with dates but a few didn't. These fellows spent the evening playing cards and watching the dancers. When the affair ended, Jim suggested that Bill and he take balloons from the decorations, so they jumped for them. This brought most of the decorations down over the heads of those who were leaving. The principal was furious with them and said they would have to see him the next day.

What might explain Jim's and Bill's actions?

Check with an x the answer or answers you think <u>best</u> explains their actions.

_x_1. They were not as mature as the other students.
____2. They wanted attention.
____3. They felt left out of the prom.
____4. It is natural for boys to act that way.
____5. They wanted the others to think they were having fun even though they didn't have dates.
____6. They had not been trained properly at home.
____7. They were bored and wanted to create excitement.
____8. They hadn't had the attention and love that they needed in childhood.
____9. They were show-offs.

*HOME ECONOMICS EDUCATION; *STUDENT EVALUATION; GRADE 9; DESIGN PREFERENCE; *TEST CONSTRUCTION; FURNITURE ARRANGEMENT; *ACHIEVEMENT TESTS; HOME FURNISHINGS; HOME MANAGEMENT; TESTING

Models for performance and problem solving test items and evaluation devices are provided for adaption by home economics teachers to the needs of specific ninth grade housing classes in the comprehensive high school. The evaluation materials were developed through research projects and trial use in Iowa schools by heterogeneous school groups. The materials are based on subject matter areas: safe, functional, and attractive interior designs, art and design principles, the aesthetic values of design, relationships between occupants, management techniques, and storage facilities. Included are: (1) objectives to which the evaluation materials relate, (2) suggestions for introducing and interpreting the results of tests, and (3) the problems presented as capsulated experiences, illustrating generalizations which require the student to give not only the answer but also justification of the answer. Line drawings illustrate the test problems. Other evaluation materials from home economics areas with similar formats are available as VT 005 746-VT 005 757 (ARM Summer 1969). (FP)

(address)

OBJECTIVES

1. Desire to make the bedroom as attractive, safe, and convenient as possible with the resources which we possess.

2. Recognition that attractive, well-arranged bedrooms which afford opportunities for varied activities can add pleasure to daily living.

3. Ability to share a room successfully.

4. Ability to apply art principles in decorating and arranging rooms.

5. Ability to maintain a clean and orderly bedroom without excessive expenditure of time and money.

6. Ability to plan, make, and use satisfactory storage space in our bedrooms.

7. Recognition of the many enjoyable possibilities for creating and renovating furnishings and accessories for our bedrooms.

DEVELOPMENT OF TEST ITEMS

The items in this packet are based on the above objectives and the generalizations given at the top of each page containing a test item. The solutions and reasons for the problems include misconceptions collected from Iowa high school pupils. The key has been approved by subject matter specialists.

USE OF TEST ITEMS

1. Selection of items to combine into a test: Choose the items which involve the generalizations on which you wish to determine where your pupils are at any stage of learning (pre-test, during unit, at the end of unit, or as a part of semester test).

2. Directions: The directions accompany each item. In order to force pupils to consider each solution and reason, the number of correct responses is not indicated.

3. Scoring the test: To obtain a score for each girl total only the correct solutions and/or reasons. (See key on copy of each item). It is better not to make deductions for incorrect choices because some of the problems are of such a nature that certain of the reasons could conceivably be true under some circumstances. The key provides for determining only those which make use of the particular generalization(s) listed at the top of each page. Also research indicates that deducting for guessing has little effect on the relative size of the scores unless a pupil checks an unreasonably large number of responses.

4. Interpreting the results of the test: The results can be looked at several ways to determine how well your pupils can apply the generalizations.

   (1) The size of the scores in relation to the total possible score gives a general idea of the class as a whole. In-

dividual scores indicate which pupils have highest achievement and which need more experiences. A look at the responses of individual pupils, particularly those whose scores are low, will indicate places where special help is needed.

(2) If the test has been given before and also after the unit has been taught, you can see the extent of progress, provided the particular problems have not been discussed in class.

(3) Tabulating the total number of pupils who selected each solution and reason gives you clues to needs for learning, whether the test is used as a pre-test or after some instruction. Noting the generalizations which they failed to apply and the misconceptions (incorrect responses), you have bases for planning experiences. Below is an item that was administered to 134 ninth-grade pupils.

Jean, a ninth-grade student, was permitted to move into her older sister's bedroom a few weeks ago, as the sister had recently married. Her parents are allowing her to change the color scheme. Her room has one large window which faces the south and one which faces the west. Below are listed two groups of colors which she likes.

Which group of colors do you think she should choose?

Group A	Group B
yellow	blue off-white
grey	grey
red	green
various shades and brightnesses of these colors	various shades and brightnesses of these colors

Check with an x the group of colors you think better.

39 ____ Group A
95 _x_ Group B

Explain your choice by checking (x) one or more of the reasons below.

24 ____ 1. There are fewer colors, and too many colors should be avoided in a bedroom.
36 ____ 2. The room needs to seem warmer, and these colors will give it a feeling of warmth.
25 ____ 3. Blues and greens are better together than reds and yellows.
27 ____ 4. These are better colors for a girl's bedroom.
81 _x_ 5. Colors with blue in them tend to be cool.
32 ____ 6. This group of colors would make the room look brighter.
19 ____ 7. Reds and yellows go together better than blues and greens.
81 ____ 8. These colors are more restful.
93 _x_ 9. The room needs cool colors since it has south and west windows.
31 ___ 10. The room needs some gay colors to go with the light from the two windows.

It is evident from the figures that although a large number (95 of 134) selected the better answer, many were still unable to do so. Also, a sizeable number believed that one should not use many colors in a bedroom and that the room needed warm, bright, and gay colors; they failed to see that colors with blue in them would be better than warm colors like red and yellow. The ideas that blues and greens or reds and yellows go together better indicate need for more experience in combining colors.

INDEX TO GENERALIZATIONS AND ITEMS FOR EVALUATION IN HOUSING: 9TH GRADE

A. Darker values advance; lighter values recede. Test Item I

B. Colors with a quantity of blue, particularly if they are near middle value, tend to be cool. Test Item II

C. Colors which are cool are best suited to south, west, or southwest exposures. Test Item II

D. Observation of traffic lanes within a room and consideration of furniture groupings for their uses and spatial appearance add to the convenience and orderly appearance of the room. Test Items III and V

E. Placing the darkest value on the floor gives a feeling of stability to the room. Test Item IV

F. Furniture arrangement is more pleasing when large pieces are placed parallel or at right angles to the structural lines of the room. Test Items V and XII

G. Vertical lines create an effect of height. Test Item VI

H. A pleasing arrangement of accessories is one which has a focal point; allows the eye to travel easily from one part of the arrangement to another; is in good proportion to the space in which it is to be placed. It also holds the objects together as a nice mass interest in shape. Test Item VII

I. A room which expresses the personality of those living in it will be more homelike. Test Item VIII

J. The choice of window treatment is determined in part by the character of the furniture. Test Item VIII

K. Intense or bright colors advance, dull or greyed colors recede. Test Item IX

L. Darker values advance; lighter and medium values tend to recede. Medium values are restful and give a feeling of spaciousness to a room. Test Item IX

M. People who share a room need to plan together for its furnishings, care, and use for maximum harmony in living. Test ItemX

N. Storage space can be used to better advantage if articles are grouped which are used together, if articles used most frequently are placed in the most convenient places, and if articles are arranged so they can be obtained without moving another article. Test Item XI

O. Energy is saved if furniture is placed where it is convenient to use. Test Item XII

P. A restful feeling is created when the furniture is arranged so that each side of the room has equal attraction and feeling of weight. Test Item XII

Q. Proportions of a room can appear to be altered by arrangement of furnishings. If furniture is placed at right angles to long walls, the room will appear shorter; however, the spaces will be more interesting if the room is not divided into two equal parts. Test Item XII

Generalization (A): Darker values advance; lighter values recede.

I. Janice is to have her bedroom painted. Because the ceiling of her room is very low, she feels it will be much more attractive if she can make the ceiling appear higher. She has already decided on the main color for the walls of her room.

Would you suggest that she paint the ceiling a lighter or a darker shade of the wall color?

Check with an x the answer you think better.

_x_ A. Lighter ceiling
____ B. Darker ceiling

Explain your choice by checking (x) one or more of the reasons below.

____ 1. Dark colors make things look larger, so the darker ceiling would make it look higher.
____ 2. Since there are two windows, there will be lots of light and too many light colors wouldn't look right.
_x_ 3. Light colors will make the ceiling look higher because light colors tend to appear farther away.
____ 4. Lighter colors will set off the other colors better than the dark.

Generalization (B): Colors with a quantity of blue, particularly if they are of middle value, tend to be cool.

(C): Colors which are cool are best suited to south, west, or southwest exposures.

II. Jean, a ninth-grade student, was permitted to move into her older sister's bedroom a few weeks ago, as the sister had recently married. Her parents are allowing her to change the color scheme. Her room has one large window which faces the south and one which faces the west. Below are listed two groups of colors which she likes.

Which group of colors do you think she should choose?

Group A	Group B
yellow	blue
grey	grey
red	green
various shades and brightnesses of these colors	off-white
	various shades and brightnesses of these colors

Check with an x the group of colors you think better.

____Group A
_x_ Group B

Explain your choice by checking (x) one or more of the reasons below.

____1. There are fewer colors, and too many colors should be avoided in a bedroom.
____2. The room needs to seem warmer, and these colors will give it a feeling of warmth.
____3. Blues and greens are better together than reds and yellows.
____4. These are better colors for a girl's bedroom.
_x_5. Colors with blue in them tend to be cool.
____6. This group of colors would make the room look brighter.
____7. Reds and yellows go together better than blues and greens.
____8. These colors are more restful.
_x_9. The room needs cool colors since it has south and west windows.
____10. The room needs some gay colors to go with the light from the two windows.

ITEM - III

A

A

B

B

Generalization (D): Observation of traffic lanes within a room and consideration of furniture groupings for their used and spatial appearance add to the convenience and orderly appearance of the room.

III. Bernice, 14, and Juanita, 15, are sisters and share the same bedroom. They have seen pictures of two room arrangements which they think they could use in their room. They have the same pieces of furniture that are pictured and the size of the rooms seems to be about the same as theirs.

Study the diagrams on the opposite page and decide which you think is better.

Check with an (x) the answer you think better.

_x_ A
___ B

Explain your choice by checking (x) one or more of the reasons below.

_x_ 1. The arrangement makes a better balanced room.
_x_ 2. Having the chest of drawers near the closet is more convenient.
___ 3. Each girl has a part of the room for her own.
___ 4. There is more space to entertain friends.
_x_ 5. Grouping the furniture into units makes a better design.

Generalization (E): Placing the darkest value on the floor gives a feeling of stability to the room.

IV. Sally is to have new rugs in her bedroom and is ready to choose them.

Should the color of the rugs be a lighter or darker shade than the ceiling and walls?

Check with an (x) the choice you think better.

_x_ A. Darker than ceiling and walls.
___ B. Lighter than ceiling and walls.

Explain your choice by checking (x) one or more of the reasons below.

___ 1. The rugs should be a contrast to the walls and ceiling.
___ 2. The darker rugs will make the floor seem larger.
_x_ 3. Darker rugs will give the room a feeling of being held in place.
___ 4. The lighter rugs would attract less attention.
___ 5. Darker rugs will tone down the rest of the room.

Generalizations (F): Furniture arrangement is more pleasing when large pieces are placed parallel or at right angles to the structural lines of the room.
(D): Observation of traffic lanes within a room and consideration of furniture groupings for their uses and spatial appearance add to the convenience and orderly appearance of the room.

V. Ann, a ninth-grade pupil, has been experimenting with the arrangement of her bedroom. She has tried the two different arrangements which are pictured below. Study the pictures and decide which is better.

Check with an (x) the arrangement you think is better.

___ Room A
_x_ Room B

Explain your choice by checking (x) one or more of the reasons below.

___ 1. All corners of the room are filled.
_x_ 2. Furniture is grouped according to use.
___ 3. Furniture is more evenly spread around the room.
___ 4. Makes room seem larger.
_x_ 5. Furniture is placed to repeat the lines of the room.

A

B

ITEM - VI

A

B

C

D

Generalization (G): Vertical lines create an effect of height.

VI. The windows in Karen's bedroom are short and wide. She is choosing curtains and wonders what kind of window treatment would look best at these windows.

Choose from the window treatments pictured on the opposite page the <u>one</u> you think best.

Check with an (x) the curtain you think best.

___ A x C
___ B ___ D

Explain your choice by checking (x) one or more of the reasons below.

___ 1. Makes window look smaller because only part of it shows.
x 2. Up and down lines give the effect of height.
___ 3. Looks more like a bedroom window.
___ 4. More like a girl's room.
___ 5. Window doesn't look so bare.
___ 6. Diagonal lines make things seem higher.
___ 7. Lets more light in.
___ 8. Curtain on bottom part only makes window seem longer.

ITEM - VII

A

B

C

D

Generalization (H): A pleasing arrangement of accessories is one which has a focal point; allows the eye to travel easily from one part of the arrangement to another; is in good proportion to the space in which it is to be placed. It also holds the objects together as a nice mass interest in shape.

VII. Marian, 14, collects pictures of movie actors. She decided to frame the pictures of her favorite stars and hang them on her bedroom walls. On the opposite page are four arrangements that she has considered placing over her bed.

Check with an (x) the one or ones you think are pleasing arrangements.

x A
___ B

x C
___ D

Explain why you chose the arrangement(s) you did by putting the numbers listed at the right beside the letter of that arrangement.

Arrangement	Numbers of reasons for choosing arrangement(s)
A	5, 7, 8
B	
C	5, 7, 8
D	

Reasons

1. Makes the room look bigger.
2. Arrangement more unusual.
3. Eye follows pictures easily.
4. Makes the ceiling look higher.
5. Repeats the lines of the bed.
6. Pictures fit the space.
7. Well-balanced.
8. Bed and pictures hold together as a unit.

Explain why you did not choose each of the other arrangements by putting the numbers of the reasons beside the letter of the arrangement.

Arrangement	Numbers of reasons for not choosing arrangements
A	
B	1, 2
C	
D	1

Reasons

1. The effect is not balanced.
2. The lines lead the eye toward the ceiling rather than to the center of interest.
3. Too plain, uninteresting arrangement.
4. Too many pictures.
5. Too few pictures.

Generalization (I): A room which expresses the personality of those living in it will be more homelike.
(J): The choice of window treatment is determined in part by the character of the furniture.

VIII. Alma is an athletic girl and enjoys outdoor sports very much. She is on the girls' basketball team although she is only a freshman. Alma brings her girl friends home with her quite frequently. Recently she has become conscious of the appearance of her room and would like to improve it. The furniture in her room consists of a Hollywood bed made by cutting down the head and foot boards from an old bed, a dressing table made from boxes, a chest of drawers, a straight chair, and a rocking chair.

Which of the materials listed below would be good choices for her bedspread and a skirt for her dressing table?

x A. Plaid Gingham
___ B. Dotted Swiss
___ C. Organdy
___ D. Taffeta
x E. Denim

Explain why you chose the material(s) by putting the numbers of the reasons listed beside the letter of the material(s).

Materials	Numbers of reasons for choosing material
A.	1, 4
B.	
C.	
D.	
E.	1, 4

1. Seems more like the type of furniture.
2. Pretty and frilly.
3. Will dress the room up a lot.
4. Fits her personality.
5. Will draw attention away from her furniture.

Explain why you did not choose each of the other materials by putting the numbers of reasons beside the letters.

Materials	Numbers of reasons for not choosing material
A.	
B.	1, 2, 4
C.	1, 2, 4
D.	1, 2, 4
E.	

Reasons

1. Too fine a material for the furniture.
2. Too delicate a fabric for her.
3. Too plain; room needs to be more feminine.
4. Too fancy for the furniture.

Suggestion to Teachers

Some pupils may not be familiar with all of these fabrics, particularly if the item is used as a pre-test. It would be helpful if swatches of each were displayed on the bulletin board for them to see and feel.

Generalizations (K): Intense or bright colors advance; dull or greyed colors recede.

(L): Darker values advance; lighter and medium values tend to recede. Midium values are restful and give a feeling of spaciousness to a room.

IX. Marilyn is going to have the walls of her bedroom painted this year. It is a very small room so she wants to choose colors to make it appear larger. She has decided to have the walls painted blue but is not sure what blue to choose.

Check with an (x) the blue she should select.

_____ A. A dark blue
_____ B. A medium blue which is bright
_x_ C. A medium blue which is dull
or _x_ D. A light blue

Explain why you chose the color you did by putting the numbers of the reasons listed beside the letter of the color.

Color	Numbers of reasons for choosing color
A.	
B.	
C.	4, 6
D.	6

Reasons

1. Dark colors give depth.
2. Bright colors make things look larger.
3. A better color for a bedroom.
4. A restful color gives spacious feeling.
5. Will attract attention and so make the room appear larger.
6. This color tends to fade into the background.

Explain why you did not choose each of the other colors by putting the number of the reasons beside the letters.

Color	Numbers of reasons for not choosing color
A.	3
B.	3
C.	
D.	

Reasons

1. Too bright for a bedroom.
2. More like a boy's choice.
3. Will attract attention to walls and make them seem to close in.
4. Sad and morbid.
5. Make it look like a baby's room.
6. Make a drab room.

* Flexible key, may be either C or D.

Suggestion to Teachers

Since some pupils may not visualize these colors well, it probably would be well to display on the board colored papers illustrating each of these colors.

Generalization (M): People who share a room need to plan together for its furnishings, care, and use for maximum harmony in living.

X. Betty, 14, and Laura Jean, 17, share a bedroom and quite often find that there are differences about who should do what in that room. If they decide they are going to rearrange the furniture, they can't agree on how to change it. Betty thinks Laura Jean doesn't do her share of cleaning and Laura Jean is sure Betty more often leaves her things lying around the room.

What suggestions can you give the sisters for settling these arguments?

Suggestions to the teachers on how to score this item

1. Give the highest score of 4 to a response which indicates that the pupil sees the need for the two girls planning together to arrange and/or clean their room. Examples given by ninth grade girls: "They should try to divide up their work among themselves." "They should make a list of their ideas and put them together."

2. Give a score of 1 to a response which does not suggest joint planning but only a "taking turns" in cleaning up or in deciding how to arrange the room. Examples given: "Each should clean the room for a week." "Arrange it the way Betty wants it awhile, then change it to the way Laura wants it."

3. Give a score of 1 to a response which suggests that they separate the room into two parts and each girl arrange hers and keep it clean. Examples: "Each have separate parts of the room". "One of them put their furniture on one side of the room and the other on the other side and each one of them clean their own."

4. Give a zero score for a suggestion that the mother or some other member of the family do the planning for cleaning and arrangement. Examples: "They could have their mother make a list of things to do." "Have the mother arrange the room for them."

Generalization (N): Storage space can be used to better advantage if articles are grouped which are used together, if articles used most frequently are placed in the most convenient places, and if articles are arranged so they can be obtained without moving another article.

XI. Mary Sue is in the high school orchestra which practices at 8 o'clock two mornings a week. These days she has to hurry to make it because she hates to get up early. Her older sister suggested that if she would arrange her clothes where she could get them easily, it wouldn't take her so long to dress.

What ideas could you give Mary Sue to use in arranging things in her closet, chest of drawers, and dressing table drawers that would help her to dress quickly?

Suggestion to teachers on how to score this item

Give a score of 1 for each of the three parts of the generalization: (1) articles are grouped together which are used together; (2) articles used most frequently are in most convenient places; (3) articles arranged so can be obtained without moving other articles.

Generalizations (O): Energy is saved if furniture is placed where it is convenient to use.

(P): A restful feeling is created when the furniture is arranged so that each side of the room has equal attraction and feeling of weight.

(F): Furniture arrangement is more pleasing when large pieces are placed parallel or at right angles to the structural lines of the room.

(Q): Proportions of a room can appear to be altered by arrangement of furnishings. If furniture is placed at right angles to long walls, the room will appear shorter; however, the spaces will be more interesting if the room is not divided into equal parts.

XII. The Morgans have just moved to a different house and Diane has to decide the best way to arrange the furniture in her bedroom. It is a story-and-half house with one room on the second floor, Diane's bedroom. It is a long room with windows only at the ends. The bathroom is on the first floor.

Below are drawings of her flor plan and the pieces of furniture.

Cut out the pieces of furniture and place them on the floor plan in different arrangements. When you have decided the best way, paste the pieces of furniture on the floor plan to show how you would place them.

(over)

Suggestions to teachers:

In scoring this essay-type item, give a value of 1 to each of the four generalizations applied in arranging the furniture. For example, generalization 0 requires that both the dressing table and chest be placed near the closet.

*HOME ECONOMICS EDUCATION; *STUDENT EVALUATION; GRADE 10; DESIGN PREFERENCES; *HOME FURNISHINGS; HOME MANAGEMENT; TESTING; *TEST CONSTRUCTION; *ACHIEVEMENT TESTS

Models for performance and problem solving test items and evaluation devices are provided for adaption by home economics teachers to the needs of specific tenth grade housing classes in the comprehensive high school. The evaluation materials were developed through research projects and trial use in Iowa schools by heterogenous school groups. The materials are based on subject matter areas: safe, functional, and attractive interior designs, art and design principles, the aesthetic values of design, relatiobships between occupants, and management techniques and storage facilities. Included are: (1) objectives to which the evaluation materials relate, (2) suggestions for introducing and interpreting the results of tests, and (3) the problems presented as capsulated experiences, illustrating generalizations which require the student to give not only the answer but also justification of the answer. Line drawings illustrate the problems. Other evaluation materials from home economics areas with similar formats are available as VT 005 747-VT 005 757 (ARM Summer 1969). (FP)

Describe

Source (agency)
(address)

HOW DO YOU FEEL ABOUT THE HOUSE OR APARTMENT IN WHICH YOU AND YOUR FAMILY LIVE?

Most of us probably feel at times like we would like to have a new house and all new furnishings in it. But not many families can do this. We all can, however, do some things to make our homes more attractive and comfortable, if we look carefully at what we have and find ways to improve even a few things.

Take a good look at your living room. The examples may help you start thinking. Do not sign your name.

How do you feel about the living room?

Examples: It is comfortable. The furniture is old but I like it. All of the family uses it, so there is no place to entertain my friends. I am ashamed to bring my friends home to see it.

Suggestions to Teachers

This device can be used to discover how pupils in Homemaking II react to the living room in their homes. Their attitudes and the problems which they recognize will be helpful in planning for and motivating a unit on housing.

Here are examples of responses given by pupils:

"Our living room has an air of friendliness about it."

"There isn't too much place for entertainment but it works."

"Our living room is too long and narrow."

"Some of our furniture is old. The davenport has just about seen its day."

OBJECTIVES

1. Recognition of factors which make rooms seem livable to different family members and the effect of surroundings upon them.

2. Ability to arrange rooms which are convenient, attractive, and safe.

3. Ability to select furniture and furnishings for maximum satisfaction.

4. Desire and ability to care for and renovate household furnishings.

5. Ability to choose appropriate backgrounds for family living.

6. Ability to choose and arrange functional and decorative accessories.

7. Understanding of one's own values and those of others which determine their choices of furnishings.

DEVELOPMENT OF TEST ITEMS

The items in this packet are based on the above objectives and the generalizations given at the top of each page containing a test item. The solutions and reasons for the problems include misconceptions collected from Iowa high school pupils. The key has been approved by subject matter specialists.

USE OF TEST ITEMS

1. Selection of items to combine into a test: Choose the items which involve the generalizations on which you wish to determine where your pupils are at any stage of learning (pre-test, during unit, at the end of unit, or as a part of semester test).

2. Directions: The directions accompany each item. In order to force pupils to consider each solution and reason, the number of correct responses is not indicated.

3. Scoring the test: To obtain a score for each girl total <u>only</u> the correct solutions and/or reasons. (See key on each item). It is better <u>not</u> to make deductions for incorrect choices because some of the problems are of such a nature that certain of the reasons could conceivably be true under some circumstances. The key provides for determining only those which make use of the particular generalization(s) listed at the top of each page. Also research indicates that deducting for guessing has little effect on the relative size of the scores unless a pupil checks an unreasonably large number of responses.

4. Interpreting the results of the test: The results can be looked at several ways to determine how well your pupils can apply the generalizations.

   (1) The size of the scores in relation to the total possible score gives a general idea of the class as a whole. Individual scores indicate which pupils have highest achievement and which need more experiences. A look at the responses of individual pupils, particularly those whose scores are low, will indicate places where special help is needed.

(2) If the test has been given before and also after the unit has been taught, you can see the extent of progress, provided the particular problems have not been discussed in class

(3) Tabulating the total number of pupils who selected each solution and reason gives you clues to needs for learning, whether the test is used as a pre-test or after some instruction. Noting the generalizations which they failed to apply and the misconceptions (incorrect responses), you have bases for planning experiences. Below is an item that was administered to 149 tenth-grade pupils.

The Smith's have a small living room with walls painted a soft, medium blue-green. The floor is covered with a gray rug. Mrs. Smith and Jane are planning new drapes for this room. They are trying to decide between a blue-green and a bright rose-red material. Both colors are good with their furnishings.

Which of these would you recommend to them to make the room seem larger?

Check with an x the color you think would be better.

84 _____ A. Rose-red
65 __x__ B. Blue-green

Explain your choice by checking (X) one or more of the reasons below.

24 _____ 1. A brighter color will make room seem larger.
51 _____ 2. The room would seem brighter.
75 _____ 3. Contrasting color will add interest to the room.
69 __X__ 4. It will blend in with walls and rug, so room will seem larger.
10 _____ 5. When drapes are same color as walls, a room is more attractive.
56 __X__ 6. Close-harmony color schemes are less spotty and add to appearance of spaciousness.

It is evident that many of these pupils were unable to apply the generalization: Draperies that blend with or match the wall color will make a room appear larger. Since Reasons 2 and 3 were often checked, they seem to have been more concerned with adding interest and making the room brighter than in increasing the apparent size. This suggests that many of these pupils need additional help in learning to apply this generalization.

Index to Generalizations and Items for Evaluation in Housing: 10th Grade

A. Price does not determine the beauty or functional value of accessories. Test Item I

B. The taller the lamp, the farther the light will be spread. Test Item I

C. A well-designed lamp has a pleasing proportion between the shade and the base. Test Item I

D. Adequate care of equipment aids in maintaining efficiency of operation. If the bag becomes clogged with dirt, a cleaner will not operate efficiently. Test Item II

E. Balance implies an approximately equal distribution of weight on either side of a central point. Test Item III

F. Good balance is necessary in order to produce a feeling of stability and repose. Test Item III

G. Furniture and accessories will be more harmonious if they are similar in scale. Test Item III

H. Observation of traffic lanes, consideration of furniture groupings for their use, placing large pieces of furniture parallel or at right angles to the structural lines of the room all add to the comfort, convenience, safety, and orderly appearance of the room. Test Item IV

I. Well-designed furniture has good proportions, suitable fittings, and structural lines which are appropriate for the function of the piece. Test Item V

J. Main backgrounds are more satisfying if consideration is given to the exposure. Test Item VI

K. Colors with a quantity of yellow, unless greyed, are hot. Test Item VI

L. Colors with a quantity of blue, particularly if they are light in value or greyed, tend to be cool. Test Item VI

M. Proportions of a room can appear to be altered by the arrangement of furniture. If furniture is placed at right angles to the long walls, the room will appear shorter; however, the spaces will be more interesting if the room is not divided into two equal parts. Test Item VII-a

N. If bold, bright designs are used on the end walls and the side walls are plain, the room will appear shorter because bold designs and bright colors appear to advance. Test Item VII-b

O. Draperies that blend with or match the wall colors will make a room larger. Test Item VIII

P. Using greyed or neutral colors for the large areas and bright colors for the small areas or accents provide a feeling of balance, if they are placed around the room so as to appear balanced. Test Item IX

Q. A feeling of support is created when a horizontal picture is mounted with the top and sides equal and the bottom margin slightly wider. Test Item X

R. Satisfactory window curtains reflect the character of the room. Test Item XI

S. A pleasing arrangement of accessories is one which combines objects that have the same feeling and scale and is in good proportion to the space in which it is placed. Test Item XII

T. A lamp is most effective when placed in such a relationship to the activity which it is to light that shadows are avoided. Test Item XIII

U. Choice of furnishings and equipment will be determined by the region, cleanliness of location, family resources (including furniture they have), size of family, ages of its members, stage in family life cycle, activities of members, and importance to them of such values as beauty, social status, comfort, security, health, sentiment, and tradition. Test Item XIV

V. A room which expresses the personality and tastes of those living in it will be more homelike. Test Item XIV

W. Talents, skills, time, desire, and creative ability of family members are factors which affect planning and furnishing. Test Item XV

Generalization (A): Price does not determine the beauty or functional value of accessories.

(B): The taller the lamp, the farther light will be spread.

(C): A well-designed lamp has a pleasing proportion between the shade and the base.

I. Jane and her mother have been shopping for a lamp to put on a table beside father's reading chair. Below are two lamps which they are considering. Both have a three-way switch and use the same size light bulb. Lamp A costs $9.95 and Lamp B costs $14.95.

A.

B.

Which of these do you think would be the better choice?

x A
____ B

Explain your choice by checking (X) one or more of the reasons below.

x 1. It has a better proportion between the shade and base.
____ 2. Expensive lamps last longer than cheaper ones.
____ 3. Low table lamps are more attractice.
x 4. The taller lamp will spread light over broader area.

Generalization (D): Adequate care of equipment aids in maintaining efficiency of operation. If the bag becomes clogged with dirt, a cleaner will not operate efficiently.

II. Jean's Saturday job at home is to clean the living room. One Saturday she noticed that the upright vacuum cleaner she was using was not cleaning the rug as well as it should. Her mother told her the dirt bag, which is not a disposable one, might need to be emptied so she checked the bag and found it was about 3/4 full. Jean said she would empty it because she thought it worked better when the bag was emptied. Her mother told her that she usually doesn't empty it until it is almost full and she thinks it works just as well.

Do you agree with Jean or her mother about emptying the bag?

Check with an x the one you think is right.

__x__ A. Jean
_____ B. Jean's mother

Explain your choice by checking (X) one or more of the reasons below.

__x__ 1. The cleaner will pick up more dirt if the bag is emptied before it is nearly full.
_____ 2. It will save time, if bag is only emptied when nearly full.
__x__ 3. If emptied frequently, the bag will not become clogged with dirt.
_____ 4. The cleaner works just as well when the bag is nearly full of dirt.

Generalization (E): Balance implies an approximately equal distribution of weight on either side of a central point.

(F): Good balance is necessary in order to produce a feeling of stability and repose.

(G): Furniture and accessories will be more harmonious if they are similar in scale.

III. Mary Lou had studied in her home furnishings class the principles of room arrangement. She planned the arrangement sketched below for one end of her family's living room.

Do you think her arrangement is good or poor?

Check with an x whether you think the arrangement is good or poor.

____A. Good
_X_B. Poor

Explain your answer by checking (X) one or more of the reasons below.

_X_1. The table and accessories on the right seem too light to balance those at the left.
____2. The arrangement creates a restful and stable effect.
____3. Tables placed at the ends of a sofa should be the same size.
____4. The furnishings are in proportion to each other.
_X_5. The table and lamp on the right are too small to harmonize with the pieces at the other end.
____6. A table and lamp at each end of sofa makes this arrangement well balanced.

Item IV

A. BEFORE

B. AFTER

Generalization (H): Observation of traffic lanes, consideration of furniture groupings for their use, placing large pieces parallel or at right angles to the structural lines of the room all add to the comfort, convenience, safety, and orderly appearance of a room.

IV. Jean's sister who has a job in the city, has just moved into a furnished apartment with a living room, kitchen and bath. Jean helped her move in and rearrange the furniture in the apartment. The apartment is shown on the opposite sheet.

Do you like the apartment better before or after they rearranged the furniture?

Check with an x your choice of arrangement.

____A. Before
_x_B. After

Explain your choice by checking (X) one or more of the reasons below.

____1. The room seems larger with no furniture in the center of the room.
_x_2. The pieces of furniture are placed close to where they're used.
____3. Having some of the furniture at an angle gives a feeling of coziness to the room.
____4. The room seems less crowded.
_x_5. The paths from door to door are clear of furniture which adds to the convenience.
____6. The dining area is separated from the living area.
_x_7. The room seems more orderly with pieces of furniture parallel to the walls.
_x_8. The room is better arranged for conversation.

Generalization (I): Well-designed furniture has good proportions, suitable fittings, and structural lines which are appropriate for the function of the piece.

V. Which of these chairs has the better design?

A.

B.

Check with an x the chair you think is better designed.

____ A
_x_ B

Explain your choice by checking (X) one or more of the reasons below.

_x_ 1. The lines are simple and harmonious.
____ 2. It looks softer and more comfortable.
____ 3. The repetition of curved lines is pleasing.
_x_ 4. The chair is graceful.
_x_ 5. It has good proportion.
_x_ 6. It isn't overly decorated.

Generalizations (J): Main backgrounds are more satisfying if consideration is given to the exposure

(K): Colors with a quantity of yellow, unless greyed, are hot.

(L): Colors with a qunatity of blue, particularly if they are light in value or greyed, tend to be cool.

VI. The Swanson's are going to redecorate their living room which has a large picture window on the south. Jean, the 16 year old daughter, suggests using soft yellow for the walls, since that is one of her favorite colors. The others in the family like greyed-blue.

Which color do you think would be better?

Check with an x the color which would be better.

__x__ A. Greyed-blue
_____ B. Soft yellow

Explain your choice by checking (X) one or more of the reasons below.

_____ 1. Yellow will make the room seem lighter.
_____ 2. Greyed-blue is a better color to use in a living room.
_____ 3. The room will seem more cheerful.
__x__ 4. Greyed-blue will make the room seem cool.

Generalization (M): Proportions of a room can appear to be altered by the arrangement of furniture. If furniture is placed at right angles to the long walls, the room will appear shorter; however, the spaces will be more interesting if the room is not divided into two equal parts.

VII-a. The Johnson's are moving into a new house. The living room is a long room. Mrs. Johnson would like it to appear less long. From the illustration below, what effect do you think Mrs. Johnson's plan for the arrangement of her furniture will have on the apparent length of the room?

Which one of these helps most to make the room seem shorter?

Check with a x the one you think helps most.

____1. Placing the desk across a corner helps to shorten the room.
____2. The room seems shorter because the furniture is arranged into groups.
__x__3. The piano and sofa form lines which are at right angles to the long wall.
____4. The arrangement provides a comfortable conversation area.
____5. Books across the end of the room seem to decrease the length.

Generalization (N): If bold, bright designs are used on the end walls and the side walls are plain, the room will appear shorter because bold designs and bright colors appear to advance.

VII-b. Mrs. Johnson is also considering the hanging of draperies across the north end of her living room. She's trying to decide between a large floral pattern in bright colors and a plain soft green fabric which matches the color of her walls. Either one would go with her other furnishings.

Which do you think would help to make her room look shorter?

Check with an X the draperies which would help to make the room look shorter.

__x__ A. Large floral pattern in bright colors.
_____ B. Plain soft green.

Explain your choice by checking (X) one or more of the reasons below.

__X__ 1. The bright floral pattern would seem nearer to you.
_____ 2. Soft, plain colors make things look smaller.
_____ 3. Plain colors seem to bring things closer together.
_____ 4. Bright colors make things look larger.

Generalization (O): Draperies that blend with or match the wall color will make a room appear larger

VIII. The Smith's have a small living room with walls painted a soft, medium blue-green. The floor is covered with a gray rug. Mrs. Smith and Jane are planning new drapes for this room. They are trying to decide between a blue-green and a bright rose-red material. Both colors are good with their furnishings.

Which of these would you recommend to them to make the room seem larger?

Check with an x the color you think would be better.

____A. Rose-red
_x_B. Blue-green

Explain your choice by checking (X) one or more of the reasons below.

____1. A brighter color will make room seem larger.
____2. The room would seem brighter.
____3. Contrasting color will add interest to the room.
_X_4. It will blend in with walls and rug, so room will seem larger.
____5. When drapes are same color as walls, a room is more attractive.
_X_6. Close-harmony color schemes are less spotty and add to appearance of spaciousness.

Generalization (P): Using greyed or neutral colors for the large areas and bright colors for the small areas or accents provides a feeling of balance, if they are placed around the room so as to appear balanced.

IX. The Homemaking II class is studying home furnishings. One of the committees in the class is looking at the living area in the homemaking department to see if the class can improve the color combination. These are the colors in use now:

Rug - light green
Wall - light grey
Sofa - light grey
Two arm chairs - dull green print
One arm chair - bright red
Pillows on sofa - several bright colors

Their budget will only allow <u>one</u> improvement this year. Here are the suggestions for improving the rooms which the members of the committee made.

Check with an x the <u>one</u> suggestion which you think is best.

_____A. Mary suggested that they cover the sofa in a light, rose-colored fabric.
_____B. Sue thought the walls should be painted light green.
__x__C. Helen wanted to cover the red chair in dusty rose.
_____D. Judy said she'd like to cover the two arm chairs in bright red.
_____E. Betty wanted to cover the dull green chairs in bright green.

Explain your choice by checking (x) one or more of the reasons below.

_____1. All of the chairs should be the same color
_____2. The room needs more bright colors for accents.
_____3. The room has too much grey in it.
_____4. Light green walls will make the room seem lighter.
__x__5. The bright colors need to be used in small amounts.
_____6. The amount of bright and dull colors should be the same.

Generalization (Q): A feeling of support is created when a horizontal picture is mounted with the top and side margins equal and the bottom margin slightly wider.

X. Helen's mother had a picture she wanted to hang in her living room. She asked Helen to mount it on a background for her. Helen experimented until she found what she thought was the most suitable mounting for the picture.

A. B. C.

Which of these three mountings do you think is best?

Check with an x the mounting you would select.

____A
_x_B
____C

Explain your choice by checking (x) one or more of the reasons below.

____1. The effect is more restful if all margins are even.
____2. When bottom and side margins are the same width and wider than the top, the picture seems larger.
____3. A picture seems balanced if the margins are the same.
_x_4. A picture seems to be supported when the bottom margin is wider and top and side margins equal.

Generalization (R): Satisfactory window curtains reflect the character of the room.

XI. Mrs. Brown asked her daughter Carol to go shopping with her to select new curtains for their living room. The living room has several antique pieces of Early American furniture, such as the Windsor chair sketched at the right, and is a comfortable, cozy, informal room.

A.

B.

C.

Which of these three types of window treatments do you think would be best for their living room?

Check with an x the one you think is best.

____A
____B
_x_C

Explain your choice by checking (x) one or more of the reasons below.

____1. The simple lines will not compete with the furniture for attention.
____2. It looks more like a living room curtain.
_x_3. This style is informal, so is more in keeping with feeling of the room.
____4. This style will make the room look more modern.
____5. It is plain and so will match the chair.

Generalization (S): A pleasing arrangement of acessories is one which combines objects that have the same feeling and scale and is in good proportion to the space in which it is placed.

XII. The Homemaking II Class has been experimenting with the arrangement of pictures above a sofa. Here are three different arrangements they made.

Which arrangement is most interesting?

Check with an x the arrangement you think is most interesting.

____A
____B
_x_C

Explain your choice by checking (X) one or more of these reasons.

____1. A contrast in size of pictures creates an interesting arrangement.
_x_2. The group of pictures is in good proportion to the sofa.
____3. An uneven number of pictures is more interesting.
____4. The lines of the pictures repeat the lines of the sofa.
_x_5. The sofa and pictures are more related in size.

Now explain why you did <u>not</u> choose the other arrangements by putting the letter in the space.

_A_1. The arrangement is monotonous and uninteresting.
_A_2. The group of pictures is too small for the sofa.
____3. The arrangement has too many pictures.
_B_4. The pictures are out of scale with each other.
_A_5. Straight lines of pictures make sofa seem too long.
____6. Lacks interest because pictures are all the same size.

Generalization (T): A lamp is most effective when placed in such a relationship to the activity which it is to light that shadows are avoided.

XIII. Here is a sketch of Jane's study desk.

If this were your study desk, what changes, if any, would you make in the lighting arrangement?

Write below any changes you would make and give the reason for each of them.

Suggestions to teachers on how to score this item

Give a score of 1 to these solutions: (1) place lamp at the left or middle, (2) put a lamp on both sides. Give only 1/2 score for these solutions: (1) move lamp closer to paper, and (2) use taller lamp. Give a score of 1 to each of these reasons: (1) the center area of the desk needs to be well lighted, and (2) shadows from her right hand should be avoided.

Generalization (U): Choice of furnishings and equipment will be determined by the region, cleanliness of location, family resources (including furniture they have), size of the family, ages of its members, stage in family life cycle, activities of members, and importance to them of such values as beauty, social status, comfort, security, health sentiment, and tradition.

(V): A room which expresses the personality and tastes of those living in it will be more homelike.

XIV. The Peterson family is beginning to make plans for redecorating their house. They have decided to start this year with the living room and have budgeted some money for it. When they went to talk with the woman in a store who had been recommended to them, they took along a sketch of the floor plan of the room showing windows, doors, etc. But she said she would need to know several things about their family before she could make suggestions about the new pieces of furniture, floor covering, and wall treatment.

List below 4 of the things you think she would need to know about the Peterson family before making suggestions for redecoration.

Explain why you think <u>each</u> of the <u>first</u> <u>two</u> things you listed is important to consider in furnishing a living room.

Generalization (W): Talents, skills, time, desire, and creative ability of family members are factors which affect planning and furnishing.

XV. Mr. and Mrs. Jones and their two teen-agers are making a recreation room in their basement. They need a table and chairs for games and eating. The price at a local furniture store for a new kitchen-type table and four chairs is $39.95. Mr. Jones thinks they should buy the used table and chairs which they found at a used-furniture store. They would cost $36.00 and could be refinished for about $3.00. They are in good condition and of good design.

What things should they consider before deciding whether to buy new table and chairs or to refinish used ones? Write your answer below.

Pub Date - 67 49p.

*HOME ECONOMICS EDUCATION; *STUDENT EVALUATION; *FOODS INSTRUCTION; NUTRITION INSTRUCTION; TESTING; GRADE 10; *TEST CONSTRUCTION; *ACHIEVEMENT TESTS

Models for performance and problem solving test items and evaluation devices are provided for adaption by home economics teachers to the needs of specific tenth grade foods classes in the comprehensive high school. The evaluation materials were developed through research projects and trial use in Iowa schools by heterogenous school groups. The materials are based on subject matter areas: nutrition, food selection and habits, fallacies and misconceptions about foods and diets, relationship of nutrition to appearance, nutrient retaining preparation techniques, and the planning, buying and storing of foods. Included are (1) objectives to which the evaluation materials relate, (2) suggestions for introducing and interpreting the results of tests, (3) forms and check lists, and (4) the problem situation, illustrating generalizations each requiring the student to give not only the answer but also justification of the answer. Other evaluation materials from home economics areas using a similar format are available as VT 005 747-005 757 (ARM Summer 1969). (FP)

Describe

Source (agency)
(address)

OBJECTIVES

1. Enjoyment of a variety of foods in order to provide more adequate personal nutrition.
2. Establishment of food habits that will result in optimum health and apparance.
3. Recognition of fallacies in commonly held conceptions about foods and diets.
4. Understanding of why an adequate diet is essential for maximum development and maintenance and recognition of valuable sources of the foods nutrients.
5. Understanding of the relationship between food nutrients and how one feels and looks.
6. Ability to prepare some products in all food groups giving consideration to retention of nutrition value.
7. Understanding of terms used in cookery.
8. Understanding of functions of ingredients in a product.
9. Ability to buy foods in the form that is most economical and nutritious, at different seasons.
10. Ability to care for and store meats, fish, and cereal products to prevent spoilage and change of flavors.
11. Ability to plan, prepare, and serve the three meals of the day with menus including more complex dishes and managerial skills (than in 9th grade) and considering limitations.
12. Ability to organize work and make decisions with a group of individuals having different abilities.
13. Appreciation of differences in family food customs.

Development of the Evaluation Materials

The check sheets and test items are based on the above objectives and on generalizations from the curriculum guide developed for use in Iowa high schools. The key has been approved by subject-matter specialists.

Uses of Evaluation Materials

1. These materials were designed for use in stimulating pupils to change their food habits and in determining where pupils are at any stage of learning: pre-test, during unit, at end of unit, or as part of a semester test.
2. In selecting the paper-and-pencil test items to use at a particular time, choose those which involve the generalizations that you are concerned with in your teaching. When using these items <u>do not</u> give the generalizations listed at the top of each sheet to the pupils.
3. The directions for responding to the paper-and-pencil test items accompany each one. In order to force pupils to consider each solution and reason, the number of correct responses is usually not indicated. If an answer sheet (see example) is used, the directions for recording responses will need to be changed accordingly.
4. To obtain a score for each girl, total <u>only</u> the number of correct responses, (See key on copy of each item), because research indicates that deducting for guessing has little effect on the relative size of the scores unless a pupil checks an unreasonably large number of responses. It appears that the pupils are checking a large number of responses in the hope of "hitting" the right one, you may want to (1) deduct one point for each incorrect response or (2) set a limit on the number of checks they may use. (If this is done, set the limit slightly above the number of correct responses, however.)
5. In interpreting the responses of your pupils
   (1) Look at the size of the scores in relation to the possible total score to obtain a general idea of the class as a whole and to determine which pupils need special help.
   (2) Tabulate the number of pupils who selected each response and see which generalizations they failed to apply and which misconceptions they hold. These suggest points at which additional learning experiences are needed.

Suggestions to Teachers for Using the check sheet, HOW AM I DOING? and the Progress Record, LEARNING TO ENJOY A VARIETY OF VEGETABLES.

Since many girls eat very few vegetables other than potatoes, it is important to help them learn to increase variety. The following suggestions are based on research about how to get persons to change their practices.

1. Before you teach the lessons on vegetable cookery, have the class fill out the checksheet, HOW AM I DOING?

2. During one of the early lessons on vegetables have them discuss the value of eating a variety of foods from the standpoints of enjoying foods, being a better guest, of improving appearance through better nutrition. Help them reach a decision to learn to enjoy three new vegetables and have them record this decision on the sheet entitled LEARNING TO ENJOY A VARIETY OF VEGETABLES. Avoid forcing them to make this decision; it should be their decision.

3. Provide opportunities during the lessons on vegetable cookery to taste vegetables which they have checked in column Have Never Eaten. Also encourage the lunchroom manager to serve a variety of vegetables.

4. Two weeks after the signing of the agreement, check up on how many trials they have recorded and encourage them to take advantage of every opportunity to try the three vegetables they selected. Remind those who have made few trials of their agreement to try to learn to enjoy them.

5. Three weeks later, check up again and give their efforts support, commending those who have arrived at the "enjoy" stage on at least one vegetable. Let them tell the others how they learned to enjoy it and report to the class the satisfaction of accomplishment.

6. For those who need to continue learning to enjoy one or more of the vegetables selected, check up every month, commending progress and encouraging those who are lagging to continue to try.

HOW AM I DOING?

Most people could enjoy their food more if they liked a wide variety of foods; then, too, they could be better guests if they ate everything served them. Learning to like many foods is an important part of really growing up, of acting more like an adult.

Below is a list of vegetables to use in checking how well you are progressing toward eating a variety of foods. Check (x) in the column or columns which best describes where you are now. If you prefer some other method of preparing any of the vegetables, add it and check in the columns.

Food	Eat it when offered		Need to learn to eat	Have never eaten; need chance to taste
	Enjoy	Do not enjoy		
Asparagus creamed				
Beans, green buttered				
Beans, lima buttered				
Beets, buttered				
Broccoli, Buttered				
Brussel sprouts buttered				
Cabbage				
salad				
slaw				
buttered				
Carrots				
raw in strips				
buttered				
Cauliflower				
raw in salad				
buttered				
Celery				
raw, stalks				
creamed				
Chinese Cabbage raw in salads				
Corn, buttered				

(over)

Foods	Eat it when offered		Need to learn to eat	Have never eaten; need chance to taste
	Enjoy	Do not enjoy		
Cucumbers raw in salads				
Egg plant, fried				
Endive raw in salads				
Kohlrabi, buttered				
Lettuce raw in salads				
Onions raw in salads				
buttered				
Parsnips, buttered				
Peas, buttered				
Peppers, green raw in salads				
Potatoes, sweet baked				
candied				
Radishes, raw				
Rutabagas, buttered				
Spinach buttered				
Greens (Kale, mustard, Swiss chard, etc.) buttered				
Squash (acorn, Hubbard, etc.) baked				
mashed & buttered				
Tomatoes raw				
soup				
juice				
Turnips, buttered				

Learning to Enjoy a Variety of Vegetables

Record of Progress

I agree to try to learn to enjoy three new vegetables .

_____

Name

A. After you have checked the list of vegetables on HOW AM I DOING?, select three that you checked Do Not Enjoy, Need to Learn to Eat, or Need Chance to Taste. Write the three selected in the table below.

B. Use every opportunity you have to taste these vegetables, eat them in small quantities, or to eat them in combination with foods you like.

C. Record (x) below each time you eat some of each vegetable until you can check Enjoy. If you need more trials, extend the table in the space below it.

Vegetable	Trials								Enjoy
	1	2	3	4	5	6	7	8	
1.									
2.									
3.									

OPINIONS ABOUT FOOD 10th

These statements are expressions of opinions which many people have. Read each statement carefully before checking (x) in the column which best indicates your belief. Do not sign your name.

Check "True" if you agree with the statement.
"Doubtful" if you doubt the truth of the statement.
"False" if you disagree with the statement.
"I don't know" if you have no idea whether the statement is true or false.

Statements	True	Doubtful	False	I don't know
1. Girls of the same age and size need about the same amount of food.	X*			
2. Vitamin pills should be taken by people who dislike many foods.		X		
3. Protein and starchy foods should not be eaten at the same meal.			X	
4. There are no shortcuts to reducing weight.	X			
5. A person who eats enough food will always be healthy.			X	
6. A person who is never sick probably has a balanced diet.		X		
7. An easy way to reduce is taking exercise.			X	
8. Some vitamins are destroyed by light.	X			
9. Vitality depends largely on the food eaten.	X			
10. Skipping breakfast is a good way to reduce.			X	
11. Drinking water with meals is bad for the digestion.			X	
12. Desserts often help to make meals more satisfying.	X			
13. A food allergy is an intense dislike for a food.			X	
14. Milk is a perfect food.			X	
15. Margarine is harder to digest than butter.			X	

* x indicates key which has been approved by specialists in Department of Food and Nutrition.

(over)

	True	Doubtful	False	I don't know
16. Eating between meals is harmful if the appetite is spoiled for meals.	X			
17. If a diet contains enough calories, it will be adequate.			X	
18. The amount of potato included in a reducing diet should be limited.	X			
19. Fish is better brain food than beef.			X	
20. Pasteurization destroys much of the food value of milk.			X	
21. Milk is fattening.			X	
22. Eating many acid fruits makes the stomach too acid.			X	
23. In general the darker the color of the food the higher the food is in vitamins.	X			
24. People who have reached physical maturity require very little milk.			X	
25. Some people are irritable because of bad eating habits.	X			
26. It is all right to skip breakfast provided the other meals meet the day's food requirements.			X	
27. Some vitamins are destroyed when exposed to air.	X			
28. Breakfast is an especially important meal.	X			
29. Butter should be limited in amount in a reducing diet.	X			
30. Foods that contain a lot of fat digest slowly.	X			
31. A high meat diet is harmful to the kidneys.			X	
32. Fatigue is one cause of poor appetite.	X			
33. Blemishes on the face may be caused by a person's diet.	X			

	True	Doubt-ful	False	I don't know
34. The texture and quality of hair depend largely upon the nutritional condition of the individual.	X			
35. Persons who are underweight often are irritable.	X			
36. There should be less meat in a reducing diet than in a normal diet.			X	
37. Diet has very little effect on vision			X	
38. Skim milk has very little nutritive value.			X	
39. A person who wants to gain weight should avoid much exercise.			X	
40. Beef is a better source of protein than chicken.			X	
41. Margarine and butter are equal in a calorie content.	X			
42. Milk and fish if served at the same time cause indigestion.			X	
43. Teenagers whose growth spurts ahead early will be taller than most of their friends for the rest of their lives.		X		
44. An overweight person should try to reduce rapidly to avoid getting discouraged.		X		
45. Adults need little protein since they have passed the growth stage.			X	
46. Milk is largely for children; little is needed by teenagers.			X	
47. Iodine is likely to be low in the diet unless a person eats much seafood or uses iodized salt.	X			
48. Gelatine (Jello will keep nails from splitting.)		X		
49. The best insurance for good nutrition is the eating of a wide variety of foods.	X			
50. A person needs to eat only if he is hungry.			X	
51. If teeth are kept clean, they won't decay.			X	
52. Rapid increase in height during adolescence may be due to eating too much food.			X	
53. Teen-aged boys usually eat more adequately than girls of that age group.	X			
54. Adding soda to vegetables when cooking causes loss of vitamins.	X			

(over)

Suggestions to Teachers

This device is designed to be used for two purposes: (1) to determine what misconceptions a class has at the beginning of a unit on foods as a basis for planning what to emphasize and (2) to determine how effective the teaching has been in eliminating misconceptions. It is not planned for use in assigning marks or grades. In order to encourage pupils to be frank in their reactions, the directions say "Do not sign your name." Instead of scoring the papers, tabulate the frequencies of the responses to find the most common misconceptions of a class.

Performance Test

This test consists of preparing a luncheon meal of creamed protein-food (chipped beef, eggs,tuna), fruit salad, (apple, celery, raisins), drop biscuits, and floating island dessert.

Data are collected through observation as the luncheon is prepared and served. Half of the class prepares the meal while the other half observes, using the Observer's Record Sheets. The following day the procedure is reversed so that all pupils will have had both experiences.

Four pupils work together in a unit kitchen. Prior to the laboratory periods, distribute the plan and record sheets so that pupils may study and discuss them. When this is used as a pretest, pupils need some experience prior to taking the pretest: working in the unit kitchens to get acquainted with arrangement of equipment and supplies, and with working partners. For this reason, two days of practice lessons before taking the pretest are recommended.

The questions on the record sheets test the pupil's ability to apply the work simplification generalizations listed below. A summary sheet is given to suggest a form to use when tabulating individual and class scores. The generalizations are coded according to the listing. Pupils' names are to be filled in on the left hand column according to the responsibilities assumed. The key for each girl indicates the number of the question(s) on the record sheets which would require application of the generalization coded above in order to be answered correctly.

Have pupils check the answers on the record sheets. The forms, as provided, suggest acceptable answers (these should be omitted when sheets are reproduced). Give one point for each question answered correctly. If any item(s) is/are checked or underscored in question five, score item zero. Each pupil can total her own scores for each generalization. These totals, when compared with the potential scores, indicate which generalizations pupils are able to apply successfully and which ones need to be worked on further.

WORK SIMPLICATION GENERALIZATIONS

A. Eliminating unnecessary steps,stooping,bending, and reaching saves energy.
B. Assembling all materials for a particular kind of work before beginning saves time and avoids confusion.
C. Selecting and using properly the best equipment available for the purpose saves time and money.
D. Stacking and cutting together food of same size and shape saves time.
E. Unpeeled vegetables and fruits add attractive color to a salad and save time and motion in preparation.
F. Routing work from right to left (right-handed person) makes more efficient motions possible and reduces time and energy.
G. Dividing tasks so all members of the group are busy but not rushed throughout the preparation and clean-up periods saves time and avoids confusion.
H. Time is saved by doing a task when or where it is easiest to perform and when it makes later tasks easier.
I. Time is saved when one uses smooth, circular motions and works continuously with both hands at the same time.
J. Using both hands to perform a task reduces motions and saves time.
K. Combining jobs which can logically be done together may save time in food preparation and clean-up.

WORK PLAN FOR PERFORMANCE TEST

Girl 1 (Salad)	Girl 2 (Creamed Protein)	Girl 3 (Drop Biscuits)	Girl 4 (Floating Island)
Get all aprons out	Put on apron and arrange equipment and supplies		
PREPARATION DUTIES			
Prepare fruit for salad	Make white sauce	Measure dry ingredients mixed previously	Mix stirred custard
Add dressing to salad	Cut, tear or separate pieces of dried beef or other protein food	Mix ingredients for biscuts	Cook stirred custard cool in refrigerator
Place lettuce on plates		Place drop biscuits on baking sheet	Beat egg whites--add sugar. Drop this meringue as islands on custard in serving dish.
Place fruit on lettuce	Add protein food to white sauce	Rinse and/or soak dishes used in preparation	
Place salad plates on table		Set table	Rinse dishes used in preparation
		Cut one biscuit in half and place on plate for creamed protein food	
		Put creamed food on opened drop biscuit, and soak or rinse pan	Serve chilled dessert
Rinse dishes used in preparation	Wash & rinse all preparation dishes placed at sink	Place any additional biscuits on plate and take to table	Dry preparation dishes
	Put away preparation dishes		
Eat			
CLEAN-UP DUTIES			
	Place silver & glasses on tray & take to sink	Take plates and serving dishes to the sink	Get dishwater ready
			Wash dishes
Put linen or cloth mats and napkins away	Put away dishes	Arrange chairs	Clean sink
Dry dishes		Wipe off surfaces	Hang up dishcloth
Put towel on rack			
Put all aprons away			

OBSERVER'S RECORD SHEET - Girl 1

PREPARATION PERIOD _____ TIME STARTED _____ TIME FINISHED
_____ TOTAL MINUTES USED

1. What did she use to get supplies outside the unit?
   x* tray or x cart ____ neither
2. How many trips outside the unit did she take to get supplies? _____
3. How many trips outside the unit did she make other than to get supplies? 0
4. Check (x) utensils which she placed on counter before she began to work.
   - x rubber scraper
   - ____ metal spatula
   - ____ measuring spoons or
   - ____ measuring cups
   - ____ wooden spoon
   - x cutting board
   - x knife, French
   - x knife, paring
   - ____ knife, table
   - ____ casserole dish
   - x mixing bowl
   - x salad plates
   - x metal mixing spoon
   - Others: paper towel, custard cup
5. Check (x) utensils which she got after starting to work
   - ____ rubber scraper
   - ____ metal spatula
   - ____ measuring spoons
   - ____ measuring cups
   - ____ wooden spoon
   - ____ cutting board
   - ____ knife, French
   - ____ knife, paring
   - ____ knife, table
   - ____ casserole dish
   - ____ mixing bowl
   - ____ salad plates
   - ____ metal mixing spoon
   - Others: _____
6. Check (x) utensils she used for cutting apples and celery.
   - Apples: x knife, French; or x knife, paring; ____ knife, table; ____ kitchen, shears
   - Celery: x knife, French; or x knife, paring; ____ knife, table; ____ kitchen shears
7. Where did she cut apples and celery?
   x on cutting board ____ on counter ____ above counter surface
8. Did she pare apples? ____ Yes x No
9. Did she place lettuce on all plates before adding fruit and dressing?
   x yes ____ no
10. Where did she stack utensils she used in making salad? x right of sink; ____ left of sink; ____ in sink
11. Did she rinse preparation dishes before sitting to eat? x yes ____ no
12. Did she complete her preparation period duties so she could begin eating at same time as Girls 2, 3, and 4? x Yes ____ no
13. Did the jobs assigned her keep her busy? x all of time; or x most of time; ____ little of time

EATING PERIOD _____ TIME STARTED _____ TIME FINISHED
_____ TOTAL MINUTES USED

CLEANING-UP PERIOD _____ TIME STARTED _____ TIME FINISHED
_____ TOTAL MINUTES USED

14. Did she use smooth circular motions in drying dishes? x yes ____ no
15. Did she stack dishes of same kind together after drying them? x all; ____ some; ____ none
16. Which hand did she use to get dishes out of the rinsing water? ____ right; x left
17. Did the jobs assigned her keep her busy? x all of time; or x most of time; ____ little of time

* Key

OBSERVER'S RECORD SHEET - Girl 2

PREPARATION PERIOD _____TIME STARTED _____TIME FINISHED
_____TOTAL MINUTES USED

1. What did she use to get supplies outside unit?
   __x__ tray or __x__ cart _____ neither
2. How many trips outside the unit did she take to get supplies? __1__
3. How many trips outside the unit did she make other than to get supplies? __0__
4. Check (x) utensils which she placed on counter before she began to work.

__x__	measuring cups	_____	hotpad holder	_____	knife, French Others: ____
__x__	measuring spoons	_____	mixing bowl	_____	knife, paring _____
_____	metal mixing spoon	_____	paper towel	_____	knife, table _____
__x__	wooden spoon	_____	cutting board	__x__	custard, cup _____
__x__	sauce pan	_____	plates, dinner	_____	metal spatula _____
_____	skillet	_____	pie pan	_____	flour sifter or strainer
__x__	double boiler	_____	kitchen shears	__x__	rubber scraper

5. Underline utensils in question 4 she got after starting to work.
6. If she used a double boiler, was water heated in bottom while she measured the ingredients for the white sauce? __x__ yes _____ no
7. How did she cut the dried beef?
   _____ cut with knife on counter _____ pulled apart with fingers
   __x__ cut with knife on cutting board __x__ cut with kitchen shears
   _____ cut with knife above counter
8. Did she rinse and stack cooking dishes and utensils she used for preparing creamed beef?

rinsed:	Stacked:
_____ all	__x__ all
__x__ some	_____ some
_____ none	_____ none

9. Where did she stack them? _____ in sink
   _____ left of sink
   __x__ right of sink
10. How many preparation dishes did she wash before eating? __x__ all
    _____ some
    _____ none
11. Did the jobs assigned her keep her busy? __x__ all of time
    or __x__ most of time
    _____ little of time

EATING PERIOD _____TIME STARTED _____TIME FINISHED
_____TOTAL MINUTES USED

CLEANING-UP PERIOD _____TIME STARTED _____TIME FINISHED
_____TOTAL MINUTES USED

12. Did she carry glasses to the sink on a tray? __x__ yes _____ no
13. Did she group glasses at right of sink? __x__ yes _____ no
14. Did she place silver on tray and take to sink? __x__ yes _____ no
15. Did she use both hands to place dishes and utensils in cupboard? __x__ Yes _____ no
16. Did the jobs assigned her keep her busy? __x__ all of time
    or __x__ most of time
    _____ little of time

OBSERVER'S RECORD SHEET - Girl 3

PREPARATION PERIOD _____TIME STARTED_____TIME FINISHED
_____TOTAL MINUTES USED

1. What did she use to get supplies outside the unit?
   __x__ tray or __x__ cart _____ neither
2. How many trips outside the unit did she take to get supplies? __1__
3. How many trips outside the unit did she make other than to get supplies? __0__
4. Check (x) utensils which she placed on counter before she began to work.
   __x__ measuring cups __x__ fork __x__ rubber scraper _____ board
   _____ measuring spoons __x__ tablespoon _____ paper towel _____ rolling pin
   _____ metal mixing spoon _____ knife, paring _____ tray Others: _____
   _____ wooden spoon _____ knife, table _____ wax paper _____
   __x__ mixing bowl _____ metal spatula __x__ baking sheet _____
5. Underline utensils in question 4 she got after starting to work.
6. When did she heat the oven?
   __x__ before starting to mix biscuits _____ not at all
   _____ when partly mixed _____ after putting biscuits in oven
   _____ just before putting biscuits in oven _____ just before eating
7. When did she rinse mixing dishes?
   __x__ after putting biscuits in oven
   _____ just before eating
   _____ not at all
8. Where did she stack her preparation dishes for Girl 2 to wash?
   _____ right of sink
   _____ left of sink
   _____ in the sink
9. Did she complete her preparation period duties so she could begin eating at same time as Girls 1, 2, and 4? _____ yes _____ no
10. Did the jobs assigned her keep her busy? { __x__ all of time / or __x__ most of time / _____ little of time }

_____TOTAL MINUTES USED

CLEANING-UP PERIOD _____TIME STARTED_____TIME FINISHED
_____TOTAL MINUTES USED

11. Did she use a tray to take plates and serving dishes to sink? __x__ yes _____ no
12. She took __1__ trip(s) to take dishes to sink.
13. Where did she stack dishes?
    __x__ right of sink
    _____ left of sink
    _____ in the sink
14. Did she stack dishes of same kind together by the sink? __x__ yes _____ no
15. Did she use both hands in wiping off surfaces? __x__ yes _____ no
16. Did she use smooth circular motions in wiping work surfaces? __x__ yes _____ no
17. Did the jobs assigned her keep her busy? { __x__ all of time / or __x__ most of time / _____ little of time }

OBSERVER'S RECORD SHEET - Girl 4

PREPARATION PERIOD _____ TIME STARTED _____ TIME FINISHED
_____ TOTAL MINUTES USED

1. What did she use to get supplies outside unit?
   __x__ tray or __x__ cart _____ neither
2. How many trips outside the unit did she take to get supplies? __1__
3. How many trips outside the unit did she make other than to get supplies? __0__
4. Check (x) in list below utensils which she placed on counter before she began to work.

__x__	measuring cups	__x__	sauce pan	_____	knife, table	____	egg beater
__x__	measuring spoons	__x__	double boiler	_____	knife, paring	Others:	_____
_____	metal mixing spoon	__x__	mixing bowl	_____	metal spatula		_____
__x__	wooden spoon	__x__	sauce dishes	__x__	rubber scraper		_____
_____	tablespoon	_____	fork	_____	hotpad holder		

5. Underline utensils in question 4 she got after starting to work.
6. Did she use smooth circular motions in stirring custard? __x__ yes _____ no
7. If she used double boiler for making custard, was the water heated in bottom of double boiler while she measured ingredients for the custard? __x__ yes ___ no
8. What utensils did she use to get all custard out of cooking utensils?
   _____ tablespoon __x__ rubber scraper _____ metal spatula
9. What utensils did she use to place meringue on custard? metal mixing spoon
10. In setting table she took 1-2 trip(s) to table to bring glasses, plates, silver, placemats, napkins and centerpiece.
    _____ trips around table to place silver
    _____ trips around table to place glasses
    _____ trips around table to place plates
    _____ total trips around table to set it.
11. What did she use to carry dishes, silver, and glasses to table?
    __x__ tray or __x__ cart _____ neither
12. Did she wipe dishes that had been washed before starting to eat?
    _____ some _____ none __x__ all
13. Did she complete her preparation period duties so she could begin eating at same time as Girls 1, 2, and 3? __x__ yes _____ no
14. Did the jobs assigned her keep her busy? { __x__ all of time / or { __x__ most of time / _____ little of time

INDEX TO GENERALIZATIONS AND ITEMS FOR EVALUATION
FOR FOODS:

A. Freezing tends to tenderize meat slightly. High temperatures and/or long cooking toughen proteins. Test Item I.

B. Decrease in weight of meats in the cookery process is in direct proportion to the increase in temperature. Test Item I.

C. Cooking in liquid may increase tenderness by softening the connective tissue. Test Item I.

D. In batters and doughs sugar affects flavor, assists in the even distribution of fat, and tenderizes. Test Item II.

E. In batters and doughs liquids release the carbon dioxide, dissolve sugar, salt, and baking powder; add food value (if milk or fruit juice); and add flavor (if fruit juice). Test Item II.

G. In batters and doughs eggs effect flavor, give rigidity to cell walls, increase lightness due to foaming qualities. Test Item II.

H. In batters and doughs leavening agents give porosity to the mixture, influence flavor and tenderness to some extent. Baking powders and soda release carbon dioxide in the presence of heat and moisture. Text Item II.

I. When a food is blanched it is dipped in boiling water and rinsed in cold water. Test Item III.

J. Boiling is cooking a food in a liquid so bubbles rise continually and break on the surface. Test Item III.

K. Broiling a food is cooking it by direct heat either with the flame directly on the food or in a pan or on a grill. Test Item III.

L. To braise or fricassee a food is to brown it in a small amount of fat, then simmer in a covered utensil in a small amount of liquid. Test Item III.

M. Parboiling is boiling a food until partially cooked. Test Item III.

N. Stewing is simmering in enough liquid to cover the food. Test Item III.

O. Sauteing is browning quickly in a small amount of fat with frequent turning. Test Item III.

P. A pie crust that is tough or leathery may be caused by too much flour on rolling board, too much handling, too much liquid, too little shortening, or underbaking (too slow an oven or too short a time). Test Item IV.

Q. A pie crust that is thin, brittle, and burns easily may have too much shortening or have been rolled too thin. Test Item IV.

R. When an unfilled pie shell puffs or blisters in the pan, it may not have been pricked enough. Test Item IV.

over

S. An unfilled shell may shrink if it is stretched when being placed in the pan. Test Item IV.

T. Fruit pie that is soggy in the bottom may have been baked in an oven that was cool at the beginning of the baking period, not baked immediately, baked in too slow an oven, or the fruit filling was not thickened before putting in crust. Test Item IV.

U. Too much shortening may cause a pie crust to be greasy and mealy. Test Item IV.

V. A butter cake is done when it is delicately browned, the surface springs back leaving no indention when pressed lightly with the finger. A toothpick or cake tester should come out dry and clean when inserted into the center of the cake. When a cake shrinks from the side of the pan, it is overdone. Test Item V.

W. An angel food cake is done when it will spring back when indented by your finger and is delicately browned. Test Item V.

X. A baked custard is done when a silver knife comes out clean after being inserted halfway between the center and the custard cup and $\frac{1}{2}$ inch below surface. Test Item V.

Y. A vegetable is done when it is easily cut with fork. Test Item V.

Z. When the crust of a butter cake is cracked or peaked in the center, the cause may be too hot an oven at first, too long a baking period, over-mixing, too much flour, too little shortening or sugar. Test Item VI.

AA. A cake that is dry may have been baked too long or have been beaten too much with an electric mixer; may have too much flour or baking powder, too little shortening and or liquid. Test Item IV.

AB. A cake with a heavy and rubbery texture may not have enough leavening, may have too much or too little sugar; too much shortening or liquid or may have been under-mixed for the richness of the batter. Test Item VI.

AC. If the crust or crumb of a cake is tough, it may have been caused by too little shortening or sugar, too much flour, over-mixing, or being baked too long. Test Item VI.

AD. Too much shortening and/or sugar for amount of stirring, too much baking powder, too little flour; or too slow an oven will cause a cake to fall or collapse. Test Item VI.

AE. A cake will be coarse if the batter is insufficiently mixed, too much baking powder is used, or oven temperature is too low. Test Item VI.

AF. Many vitamins dissolve in water and can be destroyed when exposed to light and oxygen, or when heated. Test Item VII.

AG. Nutritive values of vegetables are conserved by quick cooking in small amounts of water. Test Item VII.

AH. Fruits and vegetables, such as apples and potatoes, lose much of their vitamin C content when sieved or mashed as contact with the oxygen of the air decreases their vitamin C content. Test Item VII.

AI. Using cooked vegetables in salads is better than reheating them because reheating may cause change in color and flavor and loss of vitamins. Test Item VII.

AJ. Green vegetables become yellow-green if cooked in a covered pan. Test Items VII and VIII.

AK. Since some vitamins and minerals dissolve in water, it is better not to cut vegetables in small pieces before cooking. Test Item VII.

AL. Tunnels in muffins can be prevented if they are stirred only enough to moisten the flour. They also will be lighter, more tender, and have a better taste. Test Item VIII.

AM. Eggs foam more readily when beaten at room temperature. Test Item VIII.

AN. If butter cakes are allowed to stand in pans after baking long enough for gluten to become rigid, they are more likely to retain their shape. Test Item VIII.

AO. To prevent sweating and sogginess of crust, bread and rolls need to be removed from the baking pans immediately. Test Item VIII.

AP. The larger the amount or the more expensive the processing of a food, the higher the price as a rule. Test Item IX and XI.

AQ. Yellow vegetables are excellent sources of vitamins and minerals. Test Item X.

AR. Meat and eggs are excellent sources of protein, minerals (iron), and vitamins. Test Item X.

AS. Most fruits are valuable for their minerals and vitamins. Test Item X.

AT. Whole-grain or enriched cereals are carbohydrate-rich foods and are at the same time economical sources of protein, minerals (iron), and vitamins. Test Item X.

AU. Candy is a carbohydrate-rich food with little or no other nutrients. Test Item X.

AV. Nuts are useful sources of incomplete protein and of minerals and vitamins. Test Item X.

AW. Milk is an excellent source of minerals (calcium), protein, and vitamins. Test Item X.

AX. Butter is useful source of vitamin A. Test Item X.

AY. Salad oil contains only fat. Test Item X.

AZ. Cuts of meat from the loin or steak areas of the animal are more expensive than those from the organs or from less tender cuts of meat, yet they are no more nutritious. Test Item XI.

BA. Foods which are more perishable are more expensive than those that can be shipped and held more easily. Test Item XI.

BB. Dark Green, and deep yellow vegetables and deep yellow fruits contain more of the protective nutrients than other vegetables and fruits. Test Item XI.

BC. Dark green, and deep yellow vegetables are excellent sources of vitamins and minerals. Other vegetables supplement the minerals and vitamins furnished by these green, and yellow vegetables. Test Item XII.

BD. Meals recommended for people who need to gain weight include liberal use of fats, whole-grain or enriched cereals, sugars, meats, eggs, cheese and whole milk and plenty of fruits and vegetables. Test Item XIII.

BE. For good nutrition, reducing diets need to include adequate amount of meat, eggs, vegetables, fresh fruits, and skim or whole milk but the amounts of sugars, breads, and cereals need to be limited. Test Item XIV and XVI.

BF. When food contains too little protein, minerals, and vitamin C, the red blood cells do not have a normal amount of their red coloring matter and the skin of the individual may be pale in color. Citrous fruits are excellent sources of vitamin C but all fresh fruits make some contribution to the vitamin C content of the diet. Test Item XV.

BG. Dark Green, and deep yellow vegetables are excellent sources of vitamins, minerals, especially vitamin A and iron. Test Item XV.

BH. Meat, poultry, fish, and eggs are excellent sources of protein, and iron. Edible organ meats such as heart, kidney, liver are valued for their protein and iron contributions. Test Item XV.

BI. To maintain health it is necessary to have an adequate intake of essential nutrients. These will be supplied when a variety of foods from the four food groups is eaten each day.

The minimum recommended amounts are:

1. Milk (or equivalent) - adults 2 cups; adolescents 4 cups; children 3 to 4 cups.
2. Meat (or alternates) - 2 servings.
3. Vegetables and fruits - 4 servings, 1 citrous daily and 1 dark-green or deep yellow at least every second day.
4. Bread and cereals - 4 servings of whole grain, enriched, or restored. Test Item XVI.

BJ. Tasks are usually more effectively accomplished with satisfaction for all, if each person contributes to the extent of his ability to the making of plans, accepts responsibility for carrying out these plans, and develop skills necessary to do his job. Test Item XVII.

BK. Each individual can make a contribution to the activities of a group. Test Item XVII.

BL. Because protein, minerals, and vitamins are used for building tissues such as muscle and bone and for the formation of the constituents of blood, these needs are highest in periods of rapid growth. Protein is also important for the formation of regulating substances and the B-complex vitamins are needed to release energy from foods. Test Item XVIII

BM. Boys and girls engaging in strenuous exercise need more of the energy-rich foods, such as sugars, fats, and breads than do less active people of the same age. Test Item XVIII.

BN. Since fats provide about twice as many calories as the same weight of carbohydrates or proteins, the caloric value of foods increase as the amount of fat in the foods increases. Text Item XVIII.

BO. When children, including adolescents, receive too small a supply of protein, calcium, phosphorus, and vitamins C and D, there is danger that the growth of bones will be stunted and that the bones will be improperly shaped. Test Item XVIII.

BP. Families are alike in many ways, and yet different in many ways. Test Item XIX.

BQ. Family practices result from differences in goals, beliefs, values, cultural heritages and expectations, resources available, age of family members, occupations. Test Item XIX.

Example of an answer sheet that could be used to record responses and hence avoid having to reproduce the test items each time they are used. Can be adapted for any combination of items.

Generalizations:*

A. Freezing tends to tenderize meat slightly. High temperatures and/or long cooking toughen proteins.

B. Decrease in weight of meats in the cookery process is in direct proportion to the increase in temperature.

C. Cooking in liquid may increase tenderness by softening the connective tissues.

I. How we care for and cook meat affects it in several ways. Below is a list of treatments and list of results. Place the number or numbers of the treatment that corresponds to the result in the blank in front of the result. Some results can be expected from more than one treatment, also the treatments can be used more than once.

Results		Treatments
1, 3, 4**	A. Makes more tender	1. Freezing
2, 5	B. Makes tougher	2. High cooking temperatures
2	C. Decreases weight (shrinks)	3. Low cooking temperatures
		4. Cooking in liquid
		5. Long cooking period

*When duplicating the items for use by pupils, delete the generalizations. They are listed for each item to help you in deciding whether to select it for the test.

**In all items the key is indicated by numbers or checks. The key has been approved by specialists in the Department of Food and Nutrition.

Generalizations:

D. In batters and doughs sugar affects flavor, assists in the even distribution of fat, and tenderizes.

E. In batters and doughs fat tenderizes, helps to blend flavors, and permits incorporation of air in the mixture.

F. In batters and doughs liquids release the carbon dioxide; dissolve sugar, salt, and baking powder; add food value (if milk or fruit juice); and add fruit juice.

G. In batters and doughs eggs affect flavor, give rigidity to cell walls, increase lightness due to foaming qualities.

H. In batters and doughs leavening agents give porosity to the mixture, influence flavor and tenderness to some extent. Baking powders and soda release carbon dioxide in the presence of heat and moisture.

II. The ingredients in a batter such as muffins affect the product in several ways. Place the number or numbers of the effects which it produces beside the ingredient.

2,5	A. Sugar
2,3,4	B. Eggs
5	C. Fat
2,4,5	D. Baking powder
1,6	E. Milk

1. Releases the carbon dioxide in the baking powder.
2. Changes flavor
3. Helps to make cell walls more rigid.
4. Increases lightness
5. Makes product more tender
6. Dissolves sugar

Generalizations:

I. When a food is blanched it is dipped in boiling water and rinsed in cold water.

J. Boiling is cooking a food in a liquid so bubbles rise continually and break on the surface.

K. Broiling a food is cooking it by direct heat either with flame directly on the food or in a pan or on a grill.

L. To braise or fricassee a food is to brown it in a small amount of fat, then simmer in a covered utensil in a small amount of liquid.

M. Parboiling is boiling a food until partially cooked.

N. Stewing a food is simmering in enough liquid to cover the food.

O. Saute'ing is browning quickly in a small amount of fat with frequent turning.

III. Recipes use many terms relating to the applying of heat to foods. See if you can match the descriptions in the column on the right with the correct term on the left. Place the number of the description in the blank in front of the term. The description may be used more than once.

TERMS	DESCRIPTIONS
5 A. Blanch	1. To brown meat or vegetables in a small amount of fat, then simmer in a covered utensil in a small amount of liquid.
3 B. Boil	2. To simmer in liquid to cover.
4 C. Broil	3. To cook in a liquid so the bubbles rise continually and break on the surface.
1 D. Braise	4. To cook by direct heat either with the flame directly on the food or in a pan or on a grill.
1 E. Fricassee	5. Dip in boiling water and rinse in cold water.
6 F. Parboil	6. To boil until partially cooked.
2 G. Stew	7. Brown quickly in small amount of fat with frequent turning.
7 H. Saute'	

P. A pie crust that is tough or leathery may be caused by too much flour on rolling board, too much handling, too much liquid, too little shortening, or under-baking (too slow an oven or too short a time).

Q. A pie crust that is thin, brittle, and burns easily may have too much shortening or have been rolled too thin.

R. When an unfilled pie shell puffs or blisters in the pan, it may not have been pricked enough.

S. An unfilled shell may shrink if it is stretched when being placed in the pan.

T. A fruit pie that is soggy in the bottom may have been baked in an oven that was too cool at the beginning of the baking period, not baking immediately, oven too slow, or not thickening the fruit filling before putting in crust.

U. Too much shortening may cause a pie crust to be greasy and mealy.

IV. A good pie crust is essential for a successful pie but many things can prevent a crust being tender, light, and flaky. Mary Alice is learning to cook and is having trouble with crusts. What would you tell her causes each of these difficulties?

Place the number of the reasons which explain the failure in the blanks at the left of each failure.

	Failures	Reasons
4,5,7,12,13,15	A. Crust is tough and leathery.	1. Oven too cool at beginning
8,14	B. Crust is thin, brittle, burns easily.	2. Oven too hot
10	C. An unfilled shell that is puffed and blistered.	3. Baked too long
6,15,16	D. A fruit pie that has a soggy lower crust.	4. Not baked enough
11	E. An unfilled shell that shrinks	5. Oven too slow
14	F. A crust that is greasy and mealy.	6. Not baked immediately
		7. Too much handling of dough
		8. Dough rolled too thin
		9. Dough not rolled thin enough
		10. Shell not pricked enough
		11. Stretched too much when put in pan
		12. Too much flour
		13. Too much liquid
		14. Too much shortening
		15. Not enough shortening
		16. Fruit filling not thickened

Generalizations: 10th

V. A butter cake is done when it is delicately browned, the surface springs back leaving no indentation when pressed lightly with the finger. A toothpick or cake tester should come out dry and clean when inserted into the center of the cake. When a cake shrinks from the side of the pan, it is overdone.

W. An angel food cake is done if it will spring back when indented by your finger and is delicately browned.

X. A baked custard is done when a silver knife comes out clean after being inserted halfway between the center and the custard cup and $\frac{1}{2}$ inch below surface.

Y. A vegetable is done when it is easily cut with fork.

V. When learning to cook, one of the most common difficulties is knowing when a product has been baked or cooked enough. For these 4 products place the numbers of the best ways to test doneness in the blanks at the left of each.

Products	Cake is done when
2,4,5,8 A. Butter Cake	1. it pulls away from the side of the pan. 2. a toothpick inserted into center of cake comes out clean. 3. a fork inserted into center of cake comes out clean. 4. a cake tester inserted into center of cake comes out clean. 5. the cake is delicately browned on top. 6. cake is cracked on top. 7. cake is raised the full amount. 8. the cake springs back when indented by finger.
5,8 B. Angel Food Cake	
	Custard is done when
4 C. Baked Custard	1. it has light or golden brown crust. 2. does not stick to finger when touched. 3. silver knife comes out clean after being inserted into middle of custard. 4. silver knife comes out clean after being inserted between center and side of custard cup. 5. it is stiff.
	Frozen green beans are done when
3 D. Frozen green beans	1. they have thawed and started to boil. 2. they no longer stick together. 3. they cut easily with a fork. 4. they steam.

Z. When the crust of a butter cake is cracked or peaked in the center, the cause may be too hot an oven at first, too long a baking period, over-mixing, too much flour, too little shortening or sugar.

AA. A cake that is dry may have been baked too long or have been beaten too much with an electric mixer; may have too much flour or baking powder, too little shortening and/or liquid.

AB. A cake with a heavy and rubbery texture may not have enough leavening; may have too much or too little sugar; too much shortening or liquid; or may have been under-mixed for the richness of the batter.

AC. If the crust or crumb of a cake is tough, it may have been caused by too little shortening or sugar, too much flour, over-mixing, or being baked too long.

AD. Too much shortening and/or sugar for amount of stirring, too much baking powder, too little flour or too slow an oven will cause a cake to fall or collapse.

AE. A cake will be coarse if the batter is insufficiently mixed, too much baking powder is used, or oven temperature is too low.

VI. Making a good butter cake is a science. A cook needs to know why her cakes are not as good as they could be, if she is to improve her ability. Below are some common causes of cake failures. Place the numbers of the reasons which explain the failure in the blanks at the left of each.

Failures		Reasons
3,4,7,9,10,12	A. Cake falls	1. Cake baked too long
3,9,10	B. Cake is coarse	2. Oven was too hot at first
4,9,11,12,13,14	C. Texture is heavy and rubbery.	3. Oven too slow
1,5,6,8,10,15	D. Cake is dry.	4. Too much shortening
2,5,6,8,13	E. Crust is cracked or peaked in center	5. Too little shortening
1,5,6,8,13	F. Crust or crumb is tough.	6. Too much flour
		7. Too little flour
		8. Over-mixing
		9. Under-mixing for richness of batter
		10. Too much baking powder
		11. Not enough baking powder
		12. Too much sugar
		13. Too little sugar
		14. Too much liquid
		15. Too little liquid

Generalizations:

AF. Many vitamins dissolve in water and can be destroyed when exposed to light and oxygen or when heated.

Ag. Nutritive values of vegetables are conserved by quick cooking in small amounts of water.

AH. Fruits and vegetables, such as apples and potatoes, lose much of their vitamin C content when sieved or mashed as contact with the oxygen of the air decreases their vitamin C content.

AI. Using cooked vegetables in salads is better than reheating them because reheating may cause change in color and flavor and loss of vitamins.

AJ. Green vegetables become yellow-green if cooked in a covered pan.

AK. Since some vitamins and minerals dissolve in water, it is better not to cut vegetables in small pieces before cooking.

VII. The Hanson family has to live on a very low income, so they have trouble getting food that meets all of their nutritional requirements. They try to buy foods which are inexpensive yet have high nutritional values. If they would use the best methods of caring for and preparing foods, they would conserve more of the food values.

Which one of each of these pairs of practices would be better for them to use? Check (x) at the left the better practice and place the numbers of the reasons which explain your selection in the blank at the right.

Practice	Numbers of Reasons
A. Preparing potatoes by	
x 1. baking	2,3
2. mashing	
B. Using left-over cooked vegetables	
1. in soups	1,2,3,4
x 2. in salads	
C. Cutting carrots for cooking into	
1. small pieces	2,3
x 2. larger pieces	
D. Cooking carrots in	
1. large amount of water	2,3,4
x 2. small amount of water	
E. Cooking green beans	
1. an hour	1,2,3,4,5,6
x 2. 15 to 20 minutes	
F. Cooking green beans in	
x 1. uncovered pan	1
2. covered pan	
G. Keeping celery crisp until served by	
1. putting in cold water	2,3
x 2. putting in tight container in refrigerator	

Reasons

1. Less change in color
2. Less loss of vitamins
3. Less loss of minerals
4. Less change in flavor
5. Save fuel
6. Texture better

Generalizations:

AL. Tunnels in muffins can be prevented if they are stirred only enough to moisten the flour. They also will be lighter, more tender, and have a better taste.

AM. Eggs foam more readily when beaten at room temperature.

AN. If butter cakes are allowed to stand in pans after baking long enough for gluten to become rigid, they are more likely to retain their shape.

AO. To prevent sweating and sogginess of crust, bread, and rolls need to be removed from the baking pans immediately.

VIII. Below are several pairs of statements about preparing food. Select the best one in each pair and check (x) your choice in the blank at the left. Place the numbers of the reasons which explain your choice in the blank at the right.

Choices		Number of reasons	Reasons
When making muffins			
A. _____	1. Mix until batter is smooth	1,2,3,5	A. 1. Will be lighter 2. Will taste better 3. Will be more tender 4. Will not be lumpy 5. Will not have tunnels
x	2. Leave batter somewhat lumpy		
When beating eggs for a cake			
B. _____	1. Have them very cold	1	B. 1. Will beat better 2. Will blend better with other ingredients. 3. Cake will be better flavor
x	2. Have them room temperature		
After cakes are baked			
C. _____	1. Remove from pans immediately	4,5	C. 1. Less apt to stick to pan 2. Will cool faster 3. Less apt to fall 4. Less apt to break up 5. Gluten will become rigid
x	2. Allow to cool before removing from pan		
After bread is baked			
D. x	1. Remove from pans immediately	3,4	D. 1. Less apt to stick to pan 2. Less apt to fall 3. Prevents sweating 4. Prevents sogginess of crust 5. Will cook more quickly
_____	2. Allow to cool before removing from pan		

Generalization: 10th

AP. The larger the amount or the more expensive the processing of a food, the higher the price as a rule.

IX. If a family has to live on a low income, which one of these pairs of foods should they choose during the winter months, considering nutrition as well as cost.

Check the one which is usually lower in cost but not lower in nutritional value. If they are equal in cost and nutrition, do not check either.

A. __x__ 1. Corn, canned
____ 2. Corn, frozen

B. __x__ 1. Tomatoes, canned
____ 2. Tomatoes, fresh

C. ____ 1. Cake from a mix purchased in the store
__x__ 2. Cake mixed at home

D. __x__ 1. Dried skim milk for cooking
____ 2. Fresh skimmed milk for cooking

E. ____ 1. Orange juice from fresh oranges
__x__ 2. Canned orange juice

F. ____ 1. Pancakes from mix purchased in store
__x__ 2. Pancakes mixed at home

Generalizations: 10th

AQ. Deep Yellow vegetables are excellent sources of vitamins and minerals.

AR. Meat and eggs are excellent sources of protein, minerals (iron), and vitamins.

AS. Most fruits are valuable for their minerals and vitamins.

AT. Whole-grain or enriched cereals are carbohydrate-rich foods and are at the same time economical sources of protein, minerals (iron), and vitamins.

AU. Candy is a carbohydrate-rich food with little or no other nutrients.

AV. Nuts are useful sources of incomplete protein and of minerals and vitamins.

AW. Milk is an excellent source of minerals (calcium), protein, and vitamins.

AX. Butter is a useful source of vitamin A.

AY. Salad oil contains only fat.

X. In order to plan meals we need to know what foods are especially good sources of the food nutrients. Below is a chart of foods and nutrients. Check (x) in the blank the nutrients which each of these foods contain in <u>important amounts</u>.

Foods		NUTRIENTS			
	Carbohy-drates A	Proteins B	Minerals (1 or more) C	Vitamins (1 or more) D	None of these E
Milk		x	x	x	
Butter				x	
Eggs		x	x	x	
Meat		x	x	x	
Fruit			x	x	
Vegetables, deep yellow			x	x	
Candy	x				
Salad oil					x
Nuts		x	x	x	
Cereals, whole grain and enriched	x	x	x	x	

Generalizations: 10th

AP. The larger the amount or the more expensive the processing of a food, the higher the price as a rule.

AZ. Cuts of meat from the loin or steak areas of the animal are more expensive than those from the organs or from less tender cuts of meat yet they are no more nutritious.

BA. Foods which are more perishable are more expensive than those that can be shipped and held more easily.

BB. Dark green, and deep yellow vegetables and deep yellow fruits contain more of the protective nutrients than other vegetables and fruits.

XI. When we go to the grocery we have many choices to make between foods and most families need to make these choices wisely to keep food costs down. Which one of the following pairs of foods is the better choice from the standpoint of cost and food value? Check (x) the better one.

Foods

A. x 1. Broccoli
_____ 2. Asparagus

B. _____ 1. Round steak
x 2. Hamburger

C. _____ 1. Corn flakes
x 2. Oatmeal

D. x 1. Celery
_____ 2. Olives

E. x 1. Liver
_____ 2. Steak

F. x 1. Carrots
_____ 2. Canned Corn

G. x 1. Cabbage
_____ 2. Lettuce, head

H. _____ 1. Canned pears
x 2. Canned peaches

I. _____ 1. Canned apricots
x 2. Dried apricots

Generalizations:

BC. Dark green, and deep yellow vegetables are excellent sources of vitamins and minerals. Other vegetables supplement the minerals and vitamins furnished by these green, and yellow vegetables.

XII. The nutritive values of foods vary among foods in a group. Research indicates that we can classify vegetables as high or low in the amounts of protective nutrients: vitamins and minerals. For example, carrots have more of these nutrients than turnips.

Which of these vegetables would you put in a list of those high in protective nutrients? Place an x in the blanks in front of the 4 or 5 which are highest.

_____ 1. Peas

__x__ 2. Cabbage, raw

_____ 3. Celery

_____ 4. Lettuce, head

__x__ 5. Winter squash (such as Hubbard, acorn or butterfly)

_____ 6. Cauliflower

__x__ 7. Cantaloupe

__x__ 8. Sweet potatoes

_____ 9. Corn

__x__ 10. Greens such as kale, spinach, beet greens.

Generalization: 10th

BD. Meals recommended for people who need to gain weight include liberal use of fats, whole-grain or enriched cereals, sugars, eggs, cheese and whole milk and plenty of fruits and vegetables.

XIII. Sara is very thin and needs to gain some weight so she will be more attractive. She ate an average sized serving of these foods yesterday.

Breakfast

Orange Juice

Toast Butter

Milk

Lunch

Hamburger Sandwich

Coke

Supper

Minute Steak Boiled Potatoes

Creamed Corn

Cabbage Salad

Bread Butter

Fruit Jello

Milk

Snacks

Apple

What foods could Sara add to these or what substitutions could she make in order to gain weight?

1. Add foods to these menus that would help Sara gain weight.

2. Cross out the foods and write substitutes beside them that would be better foods for her to help her gain weight.

(See back side of sheet for suggestions on scoring.)

When scoring Item XIII, the following types of foods could well be added to the menus:

Breakfast - bacon, egg, cereal
Lunch - cake, pie, cookies, pudding
Snacks - milk
Dinner - gravy

Foods which might be substituted are:

Boiled potatoes - French Fried potatoes
Fruit jello - cake, pie, cookies and fruit, pudding
Coke - milk

Generalization: 10th

BE. For good nutrition, reducing diets need to include adequate amounts of meat, eggs, vegetables, fresh fruits, and skim or whole milk, but the amounts of fats, sugar, breads, and cereals need to be limited.

XIV. Marilyn is a little overweight and wants to reduce. She ate one average size serving of the foods in these meals and snacks yesterday.

Breakfast

Tomato Juice
Bacon Egg
Buttered Toast
Milk

Snacks

Strawberry pop (1 bottle)
Chocolate Cake

Lunch

Boiled Potatoes
Creamed Dried Beef
Bread Butter
Apricot Sauce
Milk

Supper

Fried Chicken Gravy
Mashed Potatoes Peas
Bread Butter
Apple Pie
Milk

In the blanks at the left of the foods below, mark x those she should eat only small servings. In the blanks at the right, mark those she should leave out of her diet. Do not check a food in both columns.

Small servings		Leave out
	Breakfast	
____	A. Tomato Juice	____
x	B. Bacon	____
____	C. Egg	____
x	D. Buttered toast	____
____	E. Milk	____
	Lunch	
x	F. Boiled potatoes	____
____	G. Creamed dried beef	____
x	H. Bread	____
x	I. Butter	____
____	J. Apricot Sauce	____
____	K. Milk	____

Small servings		Leave out
	Snacks	
____	L. Strawberry pop	x
____	M. Chocolate cake	x
	Supper	
____	N. Fried Chicken	____
____	O. Gravy	x
x	P. Mashed potatoes	____
____	Q. Peas	____
____	R. Apple Pie	x
____	S. Milk	____

Generalizations:

BF. When food contains too little protein, minerals, and vitamin C, the red blood cells do not have a normal amount of their red coloring matter and the skin of the individual may be pale in color. Citrous fruits are excellent sources of vitamin C but all fresh fruits make some contributions to the vitamin C content of the diet.

BG. Deep green, and deep yellow vegetables are excellent sources of vitamins, minerals, especially vitamin A and iron.

BH. Meat, poultry, fish and eggs are excellent sources of protein and iron. Edible organ meats such as heart, kidney, and liver are valued for their protein and iron contributions.

XV. Sally has little color in her skin and wants to improve her meals so she will have more color. Yesterday she ate these meals and snacks.

<u>Breakfast</u>
Tomato Juice
Toast Butter
Cereal

<u>Lunch</u>
Potato Chips
Cup cake
Milk

<u>Snacks</u>
Coke
Candy Bar

<u>Supper</u>
Minute Steak Potatoes
Canned Peas
Lettuce Salad
Chocolate Donut
Milk

Below are listed some foods that Sally might substitute for certain foods. Check (x) the substitution that would help to improve the color in her skin. If neither of the two is better than the food in the menu, do not check either substitute.

Breakfast	Substitutes
A. Cereal	____1. Bacon _x_2. Egg
Lunch	
B. Cup Cake	_x_1. Orange slices ____2. Pears
C. Potato Chips	_x_1. Meat Sandwich ____2. Jelly Sandwich
Snacks	
D. Coke	____1. Apple _x_2. Milk
F. Candy Bar	____1. Cookies _x_2. Banana

Supper	Substitutes
F. Minute Steak	____1. Hamburger _x_2. Liver
G. Head Lettuce	_x_1. Cabbage and green pepper salad ____2. Celery Sticks
H. Chocolate Donut	____1. Cake _x_2. Baked Custard

Generalization:

BI. To maintain health it is necessary to have an adequate intake of essential nutrients. These will be supplied when a variety of foods from the four food groups is eaten each day.

The minimum recommended amounts are:

1. Milk (or equivalent) - adults 2 cups; adolescents 4 cups; children 3 to 4 cups.
2. Meat (or alternates) -2 servings.
3. Vegetables and fruits - 4 servings, 1 citrous daily and 1 dark-green or deep yellow at least every second day.
4. Bread and cereals - 4 servings of whole grain, enriched, or restored.

XVI. Linda is a little over weight and she thinks it is because she eats too much between meals. Here are the meals she ate yesterday:

<u>Breakfast</u>

Egg Toast
Milk

<u>Lunch</u>

Hamburger on Bun
Buttered Green Beans
Chocolate Cake
Milk

<u>Supper</u>

Broiled Ham Gravy Mashed Potatoes
Asparagus
Cookies Milk

Here are some foods that she might eat between meals. Mark x the ones that she needs to make her day's food meet the Basic Four food requirements but <u>not</u> add to her weight?

_x_ A. Orange
____ B. Candy Bar
____ C. Lettuce sandwich
____ D. Malted Milk
____ E. Cookie
_x_ F. Milk

For good nutrition reducing diets need to include adequate amounts of meat, eggs, vegetables, fresh fuits, and skim or whole milk, but the amount of fats, sugar, bread, and cereals need to be limited.

Generalizations:

BJ. Tasks are usually more effectively accomplished with satisfaction for all, if each person contributes to the extent of his ability to the making of plans, accepts responsibility for carrying out these plans, and develops skills necessary to do his job.

BK. Each individual can make a contribution to the activities of a group.

XVII. The four girls working in one kitchen in their food laboratory are having some difficulties in getting along together. Mary Alice has had more expierence in preparing food so she usually decides what each girl should do when they are planning the preparation of their meal in the laboratory. Sometimes Ruth doesn't do all she is supposed to and when they evaluate the success of their meal, she says she was given only routine jobs to do.

Suggest at least two ideas which might help the group to have fewer difficulties.

(See back side of sheet for suggestions for scoring Item XVII.)

When scoring Item XVII, give a point of 1 for each of these ideas:

1. Each girl can and needs to contribute to the making of plans for the group (do not accept the idea of "taking turns" in making the plans.)

2. Each girl needs to accept responsibility for carrying out these plans.

3. Each girl needs to develop the skills necessary to do her job.

Generalizations: 10th

BL. Because protein, minerals, and vitamins are used for building tissues such as muscle and bone and for the formation of the constituents of blood, these needs are highest in periods of rapid growth. Protein is also important for the formation of regulating substances and the B-complex vitamins are needed to release energy from foods.

BM. Boys and girls engaging in strenuous exercise need more of the energy-rich foods, such as sugars, fats, and breads than do less active people of the same age.

BN. Since fats provide about twice as many calories as the same weight of carbohydrates or proteins, the caloric value of foods increases as the amount of fat in the foods increases.

BO. When children, including adolescents, receive too small a supply of protein, calcium, phosphorus, and vitamins C and D, there is danger that the growth of bones will be stunted and that the bones will be improperly shaped.

XVIII. Phillis' brother, Mark, 13, wants to make the high school basketball team. He is growing very rapidly, so he thinks he will be tall enough. He practices basketball every evening. Mark has asked Phyllis to help him with his diet so he can be active and grow strong. His daily diet meets the Basic Four food requirements.

Mark x the nutrients which he should be especially careful to include in generous amounts. Explain your choice in the blanks at the right.

Nutrients	Reasons
x A. Carbohydrates	A. _____
x B. Fats	B. _____
x C. Minerals	C. _____
x D. Proteins	D. _____
x E. Vitamins	E. _____

(See back side of sheet for suggestions for scoring Item XVIII.)

When scoring the reasons for Item XVIII, give a point of 1 for:

A. Carbohydrates	-	needs energy-rich foods
B. Fats	-	needs energy-rich foods and fats are the highest energy giving nutrients
C. Minerals	-	needs to develop bones, to form blood, and to build muscles
D. Proteins	-	needs to build tissues during growth and to replace worn tissue
E. Vitamins	-	needs to build tissue

Generalizations: 10th

BP. Families are alike in many ways, and yet different in many ways.

BQ. Family practices result from differences in goals, beliefs, values, cultural heritages and expectations, resources available, age of family members, occupations.

XIX. The Larson family and the Mayfield family are alike in many ways and very different in others. They have about the same income and their houses are the same size, but some of the foods and the way they eat are very different. The Larsons eat more fish and cheese than the Mayfields do. The Mayfields have their dinner at night and Mr. Mayfield serves the food at the table while the Larsons have their dinner at noon and the food is put into serving dishes which are passed to each member of the family.

What may be the reason why these two families do these things differently?

(See back side of sheet for suggestions on scoring both of these items.)

When scoring Item XIX, give a point of 1 for each of the following:

1. Cultural heritages such as different nationalities, customs in parents' homes.

2. Resources available such as time available due to work and school schedules of family members.

3. Beliefs, such as religious practices, likes and dislikes.

4. Goals and values such as status and community acceptance of certain practices as "good".

Pub Date - 36p.

*HOME ECONOMICS EDUCATION; *STUDENT EVALUATION; *CLOTHING INSTRUCTION; TESTING; *TEST CONSTRUCTION; GRADE 10; TEXTILES INSTRUCTION; *ACHIEVEMENT TESTS

Models for performance and problem solving test items and evaluation devices are provided for adaption by home economics teachers to the needs of specific tenth grade clothing classes in the comprehensive high school. Evaluation materials were developed through research projects and trial use in Iowa schools by heterogenous school groups. The materials are based on subject matter areas: fiber characteristics and their care, use of the sewing machine, garment construction and alterations, consumer education, and pattern, fabric, and clothing selection. Included are: (1) objectives to which the evaluation materials related, (2) suggestions for introducing and interpreting the results of tests, and (3) the problems presented as capsulated experiences, illustrating generalizations which require the student to give not only the answer, but also justification of the answer. Other evaluation materials from home economics areas, all using similar formats, are available as VT 005 747-VT 005 757 (ARM Summer 1969). (FP)

Would not be used in present form but adapted by teacher for use in particular classes.

Describe

Source (agency)
(address)

Objectives

1. Ability to select and alter patterns.
2. Ability to construct garments using good management practices.
3. Recognition of good fit in garments.
4. Ability to store and arrange sewing equipment for efficient work.
5. Understanding of terms used in construction, textiles, and design.
6. Ability to select patterns, fabrics, and garments considering line, color, texture, purpose, proportions of figure.
7. Ability to plan a wardrobe.
8. Understanding of characteristics of fibers and fabrics in relation to care.
9. Understanding of labels.

Development of the Evaluation Materials

The paper-and-pencil test items and the crossword puzzle are based on the above objectives and on generalizations from curriculum guides developed for use in Iowa high schools. The keys have been approved by subject-matter specialists.

Use of Evaluation Materials

1. These were designed for use in determining where pupils are at any stage of learning: pre-test, during unit, at end of unit, or as part of a semester test.

2. In selecting the paper-and-pencil test items to use at a particular time, choose those which involve the generalizations which you are concerned with in your teaching. When using these items do not give the generalization listed at the top of each sheet to the pupils.

3. The directions for responding to the paper-and-pencil test items accompany each one. In order to force pupils to consider each solution and reason, the number of correct responses is not indicated. If an answer sheet (see example) is used, the directions for recording responses will need to be changed accordingly.

4. To obtain a score for each girl, total only the number of correct responses (See key on copy of each item) because research indicates that deducting for guessing has little effect on the relative size of the scores unless a pupil checks an unreasonably large number of responses. If it appears that the pupils are checking a large number of responses in the hope of "hitting" the right one, you may want to (1) deduct one point for each incorrect response or (2) set a limit on the number of checks they may use. (If this is done, set the limit slightly above the number of correct responses, however).

5. In interpreting the responses of your pupils

   (1) Look at the size of the scores in relation to the possible total score to obtain a general idea of the class as a whole and to determine which pupils need special help.

   (2) Tabulate the number of pupils who selected each response and see which generalizations they failed to apply and which misconceptions they hold. These suggest points at which additional learning experiences are needed.

ACROSS

1. To make a temporary stitch (baste)*
2. Red, yellow, blue (colors)
3. Strongest method of fastening ends in machine sewing (backstitching)
4. Direction of fabric yarns (grain)
5. Type of stitch used on hems (blindstitch)
6. One who makes clothing (tailor)
7. Gliding of motion of iron (ironing)
8. V-shaped markings on pattern (notches)
9. Thin ribbon used to finish raw edges (tape)
10. Diagram on pattern guide (layout)
11. To stitch (sew)
12. Opening in garment (placket)
13. Edge of woven fabric (selvage)
14. Up-and-down motion of iron (pressing)
15. Metal fasteners (snaps)
16. To fold and sew down the edge of (hem)
17. Difference between body measurements and the measurements of the pattern pieces at a given point as provided by the designer (ease)
18. Instrument used for transferring pattern markings (tracing wheel)
19. To change a pattern (alter)

DOWN

(1). Vertical yarns of fabric (lengthwise)
(2). Piece of material sewed to and used to finish raw edge (facing)
(3). Used to indicate construction details (markings)
(4). Slanting line off the straight grain (bias)
(5). Top of sleeve (cap)
(6). Distance from cut edge to stitching line of garment piece (seam allowance)
(7). Line found on both pattern and fabric (grainline)
(8). Fold of material stitched to give shape (dart)
(9). Piece of equipment used in hand stitching (thimble)
(10). Characteristics or forms, outlines, or shapes of garments (styles)
(11). Type of buttonhole (bound)
(12). Machine part that holds fabric steady (presser foot)
(13). Stitch to prevent stretching (staystitch)
(14). Type of seam (plain)
(15). To cut slits (slash)
(16). Equipment used in sewing (needle)

*Words in parentheses indicate key to crossword puzzle. Delete these when giving the puzzle to pupils to solve.

Example of an answer sheet which could be used to record responses and, hence, avoid having to reproduce the test items each time they are used. Can be adapted for any combination of items.

INDEX TO GENERALIZATIONS -- FOR CLOTHING: 10th GRADE

A. Since reducing a pattern piece is easier than enlarging it, it is better to choose the larger size if your bust or hip measurement comes between two sizes of a blouse or skirt pattern. Test Item I.

B. The waist and hemline of a well fitted garment appear to be parallel to the floor unless the design requires that they be otherwise. Test Item II.

C. The lengthwise grain of the material in a well-fitted garment appears to be perpendicular to the floor at center front and back unless the design requires that they be otherwise. Test Item II.

D. In a basic, one-piece sleeve the lengthwise grain hangs perpendicular to the floor from the top of the shoulder to the elbow, and the crosswise grain in the sleeve cap is parallel to the floor. Test Item II.

E. Pressing is most satisfactory when an up-and-down motion is used which retains the original texture of the fabric and keeps grain lines at right angles except when shaping the fabric. Test Item III.

F. A gliding motion with the iron is used only when it is desirable to smooth fabric, square up grain lines, and develop luster. Test Item III.

G. If a pattern grainline is laid on the fabric grainline, there is less danger of fabric stretching, the garment can hang as the designer planned, and it is more likely to fit well. Test Item IV.

H. A method of marking is satisfactory if it can be accomplished accurately, will not show on the completed garment, and will remain long enough for use but can be removed easily.
   (1). Snipping into the seam allowance weakens the fabric in the seams
   (2). Wax chalk disappears under heat on wool fabrics, but is likely to make oily stains on synthetic and cellulose fibers.
   (3). Markings made by a tracing wheel can be transferred accurately because the pattern does not have to be removed.
   (4). Lead pencil is seldom used for marking except on interfacings because it is difficult to remove from the finished garment. Test Item V.

I. Applying moderate heat and moisture to wool makes a garment easier to shape. High, dry heat results in scorching and harshness of the wool. Test Item VI.

J. The kind and condition of the fabric and the style of the garment determines the kind of hem finish to use.
   (1). Fullness is shrunk from wool to keep hem inflared skirt from puckering
   (2). Transparent fabrics require hem stitches that show as little as possible
   (3). Edge stitching provides a durable finish.
   (4). Seam tape prevents raveling. Test Item VII.

K. The design of the pattern is more apt to be retained if pattern alterations preserve the pattern outline wherever possible, but when an alteration changes the outline of the pattern, new lines need to be drawn so that adjacent sections fit. Test Item VIII.

L. Time and energy are saved and confusion lessened when items are stored near where they are first used, grouped with items with which they are used, and stored so they can be removed from storage without moving another article; items used most frequently need to be stored in the most accessible place. Test Item IX.

M. Seams will be more durable and have a better appearance if they are appropriate for the fabric and design of the garment.
(1). French seams are used on transparent or light-weight fabrics because they eliminate raw edges and prevent raveling.
(2). Flat-felled seams are used on garments that receive rough wear because they are durable, flat, smooth, easily ironed, and prevent raveling.
(3). Plain seams create the least amount of bulk.
(4). Lapped seams are used to make curved or pointed seams where stitching inside is difficult. Test Item X.

N. Seam finishes will be more durable and have a better appearance if the finish to be used is appropriate for the fabric and design of the garment.
(1). A raw edge seam finish is adequate if a fabric is not sheer, does not ravel easily, and will not receive hard washing or wear. It is also adequate for enclosed seams as in collars and cuffs.
(2). A selvage edge cannot ravel and needs no finish, so is suitable for straight side seams.
(3). Raw edges stitched together $\frac{1}{4}$" from the seamline are suitable for firm fabrics at the armhole and waistline seams because they are easy to do, save time, and are not too bulky. Test Item XI.

O. A garment is most attractive when the texture of the fabric does not compete with the lines of the pattern. Test Item XII.

P. When you make a plan of your resources, you are more likely to get the clothing most important to you. Test Item XIII.

Q. If a new garment combines well with colors, textures, lines, and purpose of garments on hand, it can be worn more often. Test Item XIII.

R. Line may be used to comouflage or improve unattractive proportions in a figure,
(1). Oversized pockets, belts, buttons, or accessories emphasize shortness.
(2). Vertical panels will slenderize the figure if they are smaller at the waistline than shoulder or hipline. Test Item XIV.

S. Fabric textures can reveal, increase, or camouflage the natural lines of your figure and make you appear more nearly the size you want to be.
(1). Stiff, crisp, or bulky fabrics increase or build out the figure.
(2). Soft, clinging fabrics reveal the figure. Test Item XV.

T. Colors with a quantity of red or yellow, unless greyed, tend to be warm. Colors with a quantity of blue, particularly if they are middle value, tend to be cool. Test Item XVI.

U. Warm colors are usually becoming to the warm type and cool colors to the cool type. Test Item XVII.

V. A feature can be accented by wearing colors that repeat or contrast the color or value of the feature. Test Item XVIII.

W. Becoming colors are those which give your complexion a natural, healthy appearance. Test Item XVIII.

X. Specific combinations of color may be identified by their proper names.
   (1). A monochromatic color harmony is composed of different values and intensities of the same color.
   (2). An analogous color harmony is composed of related colors lying next to each other on the color wheel. Because related colors create a blended effect, they combine harmoniously together.
   (3). Colors included in a complementary scheme come from opposite sides of the color wheel.
   (4). A triad color harmony is composed of colors which, when joined, form an equilateral triangle on the color wheel. Test Item XIX.

Y. Because woolens are made of short fibers (lying at all angles) they are thick, soft, and spongy with a slight nap which increases the warmth and softness of the fabric, but causes them to soil easily. Test Item XX.

Z. Because worsteds are made of long fibers, laid parallel as they are spun, they are firm, resilient with little nap or fuzz. Worsteds hold their shape and retain creases well, but develop a shine with wear. Test Item XX.

AA. Durability of color in any fabric cannot be judged and must be guaranteed by label. Test Items XXI, XXV.

AB. Fabrics with a crease resistant finish will resist wrinkles during wear. Test Item XXI.

AC. The amount of shrinkage in any fabric cannot be judged and must be guaranteed by label. Test Items XXI, XXV.

AD. If a garment must be hand washed, the label needs to give this information. Test Item XXI.

AE. Fabrics with woven designs usually show wrinkles less than fabrics woven without designs. Test Item XXII.

AF. Heavy fabrics wrinkle less than light-weight fabrics. Test Item XXII.

AG. It is important to recognize the weave of the fabric.
   (1). Twill weave produces a diagonal effect.
   (2). Satin weave produces a smooth, lustrous fabric.
   (3). Pile weave produces a soft, deep surface effect. It has an up and down
   (4). In plain weave every yarn interlaces with every other yarn. Unless it is printed or has a surface finish, it has no right or wrong side. There is also good balance between warp and filling. Test Item XXIII.

AH. Loosely woven fabrics tend to shrink. Test Item XXIV.

AI. Twill weave is often used on work clothes because it can have more yarns per square inch and so will be stronger than plain weave. Test Item XXVI.

AJ. Soil shows most on smooth, plain surfaces. Test Item XXVI.

Crossword Puzzle

Generalization*A: Since reducing a pattern piece is easier than enlarging it, it is better to choose the larger size if your bust or hip measurement comes between two sizes of a blouse or skirt pattern.

I. Evelyn is selecting a skirt pattern and her hips measure 34 inches. The pattern that she has selected is available only in sizes 33 and 35. Which size should she buy?

Check (x) the size which is better for her to buy.

____A. Size 33
x** B. Size 35

Check (x) the reason(s) that explains your choice

_x_1. It is easier to reduce a pattern piece than to enlarge it.
____2. It is better to buy size 35 so the skirt will fit loosely rather than fit tightly over the hips.
____3. It is easier to enlarge a pattern piece than to reduce it.
____4. It is better to take smaller seams than to alter the pattern.
____5. If she buys size 35, she can make larger seams and darts.
____6. Evelyn might still be growing and she would need an extra inch.

* Do not give the pupils the generalizations. They are listed at the top of each item to help you in deciding whether to select the item for your test.

** Indicates response approved by specialists in textiles and clothing in this and subsequent items.

Generalization B: The waist and hemline of a well-fitted garment appear to be parallel to the floor unless the design requires that they be otherwise.

C: The lengthwise grain of the material in a well-fitted garment appears to be perpendicular to the floor at center front and back unless the design requires that they be otherwise.

D: In a basic, one-piece sleeve the lengthwise grain hangs perpendicular to the floor from the top of the shoulder to the elbow, and the cross-wise grain in the sleeve cap is parallel to the floor.

II. According to present style, how do the lines of a well-fitted garment appear to be in relation to the floor?

Mark with an (O) the lines that appear to be perpendicular (at right angles,1) to the floor.
Mark with an (x) the lines that appear to be parallel to the floor.

Lines

O 1. Center front
O 2. Lengthwise grain in a basic one-piece sleeve
x 3. Hemline
O 4. Center back
x 5. Waist line
x 6. Crosswise grain in sleeve cap

Generalization E: Pressing is most satisfactory when an up-and-down motion is used which retains the original texture of the fabric and keeps grain lines at right angles except when shaping the fabric.

F: A gliding motion with the iron is used only when it is desirable to smooth fabric, square up grain lines, and develop luster.

III. Mary is teaching a younger sister how to use the iron correctly when ironing or pressing her clothes and when making garments. Would she tell her to iron (a gliding motion of the iron) or press (up-and-down motion of the iron) to get each of the results listed below?

Indicate with an I the results produced by ironing. Indicate with a P the results produced by pressing. Some results may be produced by both ironing and pressing.

	Results
P-I	1. Square up grain lines
P-I	2. Retain original texture of fabric
P-I	3. Retain fabric grain lines
P-I	4. Smooth the fabric
I	5. Develop luster
P	6. Shrink out fullness
P	7. Shape points of a dart

Generalization G: If a pattern grainline is laid on the fabric grainline, there is less danger of fabric stretching, the garment can hang as the designer planned, and it is more likely to fit well.

a

IV. Shirley is going to make a sleeveless cotton blouse at home using a pattern that her sister has used. The pattern guide has been lost. However, Shirley has studied the pattern pieces and is trying to place the pieces on her fabric. She thinks that she won't have enough fabric unless she places the pattern front off grain. How will the finished garment be affected if she places the front off grain?

Check (x) the statement(s) that explains what will happen if she places the front off grain.

___1. The pieces of the blouse will not fit together
_x_2. The garment will not hang as the designer planned
_x_3. The blouse may not fit properly
___4. The fabric will ravel easier
_x_5. The blouse pieces may stretch out of shape
___6. The garment will not iron as well.

Generalization H: A method of marking is satisfactory if it can be accomplished accurately, will not show on the completed garment, and will remain long enough for use but can be removed easily.

(1). Snipping into the seam allowance weakens the fabric in the seams
(2). Wax chalk disappears under heat on wool fabrics, but is likely to make oily stains on synthetic and cellulose fibers.
(3). Markings made by a tracing wheel can be transferred accurately because the pattern does not have to be removed.
(4). Lead pencil is seldom used for marking except on interfacings because it is difficult to remove from the finished garment.

V. Marty is making a yellow pique blouse and Charlotte is making a gray wool flannel skirt. Marty is ready to mark a dart in her blouse and Charlotte is ready to mark a pleat in her skirt.

Which is the best for <u>each</u> girl to use in marking?

1. Wax chalk
2. Tracing wheel and tracing paper
3. Lead pencil
4. Snipping (with scissors) into seam allowance

In the blanks at the <u>left</u> place the number of the best marking for <u>each</u> girl to use.

2 A. Dart in Marty's blouse 5,8,9
1 B. Pleat in Charlotte's skirt 3,7,8

In the blanks at the <u>right</u> place the number(s) of the reason(s) that explains each choice. Any reason may be used more than once.

1. Tracing wheel and tracing paper give marks that will show up on any fabric during construction.
2. Heavy fabric should be snipped because markings are easier to see.
3. Heat will make the markings disappear.
4. Best color of tracing paper can be chosen for each color of fabric.
5. Markings can be transferred accurately because the pattern does not have to be removed.
6. Markings are permanent.
7. Markings are easily removed when the garment is completed.
8. Markings will remain long enough for use.
9. Fastest and easiest method.

Generalization I: Applying moderate heat and moisture to wool makes a garment easier to shape. High, dry heat results in scorching and harshness of the wool.

VI. Doris and Judy are pressing the hems in the woolen skirts that they are making. Doris thinks that they should use moderate heat and moisture and Judy thinks they should use dry, high heat. Which would be the better kind of heat to use on the woolen skirts?

Check (x) the kind of heat to use on the woolen skirts.

____A. Dry and high heat
_x_B. Moderate heat and moisture

Check (x) the reason(s) that explains your choice.

_x_1. The wool will be less apt to scorch
____2. Wool absorbs heat quickly
____3. Moisture will mat the wool fibers
____4. Moisture makes wool shiny
_x_5. Moderate heat and moisture are less apt to make the wool fabric harsh.
_x_6. Heat, moisture, and pressure make the fabric crease easily.

Generalization J: The kind and condition of the fabric and the style of the garment determine the kind of hem finish to use.

(1). Fullness is shrunk from wool to keep hem in flared skirt from puckering
(2). Transparent fabrics require hem stitches that show as little as possible
(3). Edge stitching provides a durable finish
(4). Seam tape prevents raveling.

VII. Macky needs to put hems in these garments

2	A. Flared wool flannel skirt	1,3
1	B. Cotton print housedress	9
3	C. Organdy gathered skirt	6

In the blanks at the <u>left</u> of each garment above, place the number of these hem finishes which is <u>best</u> for that garment.

<u>Hem Finishes</u>

1. Turn raw edges under and stitch by machine, then blind stitch hem in place
2. Gather edge, shrink out fullness, stitch seam tape flat to cover raw edge, and hem.
3. Turn raw edge under, then blind stitch the turned edge
4. Turn edge under and stitch in place by machine.

In the blanks at the <u>right</u> of each garment, place the number (s) of these statement(s) which explains the reason(s) for each choice.

1. Fullness needs to be shrunk out to keep the hem from puckering
2. Garments look more expensive when the hem is put in by hand.
3. Seam tape prevents raveling
4. Hems look neater when put in by hand
5. Stitching by hand is more secure
6. Transparent materials require hem stitches that show as little as possible
7. Loosely woven fabrics need to be machine stitched
8. Hems stay in better when machine stitched
9. Edge stitching provides a durable finish

Generalization J: The kind and condition of the fabric and the style of the garment determine the kind of hem finish to use.

(1). Fullness is shrunk from wool to keep hem in flared skirt from puckering
(2). Transparent fabrics require hem stitches that show as little as possible
(3). Edge stitching provides a durable finish
(4). Seam tape prevents raveling.

VII. Macky needs to put hems in these garments

2	A. Flared wool flannel skirt	1,3
1	B. Cotton print housedress	9
3	C. Organdy gathered skirt	6

In the blanks at the left of each garment above, place the number of these hem finishes which is best for that garment.

Hem Finishes

1. Turn raw edges under and stitch by machine, then blind stitch hem in place
2. Gather edge, shrink out fullness, stitch seam tape flat to cover raw edge, and hem.
3. Turn raw edge under, then blind stitch the turned edge
4. Turn edge under and stitch in place by machine.

In the blanks at the right of each garment, place the number (s) of these statement(s) which explains the reason(s) for each choice.

1. Fullness needs to be shrunk out to keep the hem from puckering
2. Garments look more expensive when the hem is put in by hand.
3. Seam tape prevents raveling
4. Hems look neater when put in by hand
5. Stitching by hand is more secure
6. Transparent materials require hem stitches that show as little as possible
7. Loosely woven fabrics need to be machine stitched
8. Hems stay in better when machine stitched
9. Edge stitching provides a durable finish

Generalization K: The design of the pattern is more apt to be retained if pattern alterations preserve the pattern outline wherever possible, but when an alteration changes the outline of the pattern, new lines need to be drawn so that adjacent sections fit.

VIII. Ann is making a dress with set-in sleeves and her shoulders measure $\frac{1}{2}$ inch longer than her pattern. Which of the methods below would you advise her to use so the dress will fit her shoulders?

Check (x) the best method for her to use

____A. Alter back and front pattern pieces by extending armseye end of shoulder seam with $\frac{1}{2}$ inch of paper, tapering to notches of armseye, and redrawing the shoulder lines.

____B. When cutting out the dress, add $\frac{1}{4}$ inch to both front and back armseye and $\frac{1}{4}$ inch to top of sleeve.

_x_C. Slask back and front pattern pieces through the shoulder seam to the notch at armseye seam. Spread slash $\frac{1}{2}$ inch at shoulder seam, tapering toward the armseye, insert paper, and redraw shoulder lines.

____D. Place the center back and center front of the pattern away from fold far enough to enlarge it $\frac{1}{2}$ inch.

____E. Cut pattern back and front pattern pieces in half lengthwise, insert $\frac{1}{2}$ inch paper, and redraw shoulder lines.

Check (x) the reason(s) for your choice.

____1. Ann should use A because only the shoulders need to be longer. The underarms or sleeves should remain as they are.

_x_2. The pattern design will more likely be the same if the alterations preserve the pattern outline.

____3. It is easy and quick because there are few steps to follow.

_x_4. New lines need to be drawn so that all sections will fit together if alterations change the pattern outline.

____5. Method E will add the desired length without changing the outline of the armseye.

____6. Method B will make only the sleeves longer. It will not change the size of the bodice of the dress.

Generalization L: Time and energy are saved and confusion lessened when items are stored near where they are first used, grouped with items with which they are used, and stored so they can be removed from storage without moving another article; items used most frequently need to be stored in the most accessible place.

IX. Peggy has decided to sew one hour each evening. She has discovered that she does not get very much sewing done because she has to spend so much time assembling the equipment. Her mother has suggested that if she would arrange her pieces of equipment where she could get them easily, it would not take her so long.

List all ideas you could give Peggy to use in arranging her supplies and equipment.

Suggestions for scoring

Give a score of 1 for each of the following ideas:

1. Store items near where they are first used.
2. Group all items together that are to be used together.
3. Store items so they can be removed without moving another article.
4. Items most frequently used need to be stored in the most accessible place.

Generalization M: Seams will be more durable and have a better appearance if they are appropriate for the fabric and design of the garment.

(1). French seams are used on transparent or light-weight fabrics because they eliminate raw edges and prevent raveling.
(2). Flat-felled seams are used on garments that receive rough wear because they are durable, flat, smooth, easily ironed, and prevent raveling.
(3). Plain seams create the least amount of bulk.
(4). Lapped seams are used to make curved or pointed seams where stitching inside is difficult.

X. Dora's class has been studying types of seams. The teacher has given them a list of garments and asked them what kind of seam is appropriate for that garment. Which of these four seams is most appropriate for each of the garments listed below?

In the blanks on the left of each garment, place the number (1,2,3,4) of the seam which is most appropriate for that garment.

Garments	Seams
1 A. Seams in an organdy blouse 3,7	1. French seam
4 B. Seam joining pointed yoke to back of blouse made of cotton broadcloth 8	2. Flat-felled seam
2 C. Inside seam of denim pedal pushers 5,7	3. Plain seam
	4. Lapped seam

In the blanks on the right of each garment, place the number(s) of the reason(s) that explain the choice for that garment.

Reasons

1. Used only for sports clothing
2. Used on everyday clothes rather than dressy ones
3. Used on transparent or light-weight fabrics because it doesn't leave raw edges
4. Plain seams are usually used on cotton garments
5. Used on garments that will receive rough wear
6. French seams are used on heavy materials
7. Prevents raveling
8. Used to make curved or pointed seams where stitching from inside in difficult
9. Makes least amount of bulk

Generalization N: Seam finishes will be more durable and have a better appearance if the finish to be used is appropriate for the fabric and design of the garment.

(1). A raw edge seam finish is adequate if a fabric is not sheer, does not ravel easily, and will not receive hard washing or wear. It is also adequate for enclosed seams as in collars and cuffs.
(2). A selvage edge cannot ravel and needs no finish so is suitable for straight side seams.
(3). Raw edges stitched together $\frac{1}{4}$" from the seamline are suitable for firm fabrics at the armhole and waistline seams because they are easy to do, save time, and are not too bulky.

XI. Listed below are 6 ways of finishing a plain seam.

1. Raw edge
2. Selvage
3. Raw edges stitched together $\frac{1}{4}$" from seamline
4. Pinked
5. Each raw edge turned under and stitched
6. Raw edges overcast

For what kind of fabric would it be best to use each of these seam finishes?

In the blanks, place the number of the seam finish for each fabric. A finish may be used more than once.

Description of fabrics

5 A. Light-weight, ravelly fabric that will not press mark
6 B. Ravelly, thick fabric for a skirt
1,2,4 C. Straight side seam of a gathered skirt made of firm dress-weight fabric
1 D. Fabrics that do not ravel or will not be washed often or hard
3,6 E. Used at armhole and waistline seams on firm fabrics.
1,4 F. Closely woven wash fabrics or those for dry cleaning only.

Generalization O: A garment is most attractive when the texture of the fabric does not compete with the lines of the pattern.

XII. Frances is looking for fabric suitable for this pattern with a tucked bodice.

She has found these two fabrics that she likes and of similar price. Which of the two fabrics shown on the Bulletin Board* would be most suitable for her pattern?

Check (x) the most suitable material for her pattern.

x A. Wool jersey
___ B. Corduroy

Check (x) the reason(s) that explains your choice.

___ 1. B is the more durable fabric
___ 2. The vertical lines of the corduroy emphasize the vertical lines of the tucks.
___ 3. B will hold its shape better than A
___ 4. Bulky fabrics are best for full skirts because they will stand away from the body
x 5. The fabric texture does not compete with the lines made by tucks in the blouse

Description of illustrative material needed.
Display on Bulletin Board these two fabric samples: a wool jersey sample designated as A and a corduroy sample designated as B. These samples should be the same color, if possible.

Generalization P: When you make a plan of your resources, you are more likely to get the clothing most important to you.

Q: If a new garment combines well with colors, textures, lines, and purpose of garments on hand, it can be worn more often.

XIII. Yvonne has a very limited budget. She needs to make her decisions very carefully so that she gets maximum use from each garment that she chooses. She can purchase <u>one</u> new garment this season.

A. <u>Before</u> she goes shopping, what should she do to help her decide what she needs most?

B. After she has decided what garment she needs, what factors should she consider in selecting this garment at the store?

Suggestions for scoring

Give a score of 1 for each of these five ideas

A. Make a plan of present wardrobe

B. She should consider whether the new garment combines well with what she has on hand from the standpoint of

1. Color
2. Texture
3. Lines
4. Purpose

Generalization R: Line may be used to cemouflage or improve unattractive proportions in a figure.

(1). Oversized pockets, belts, buttons, or accessories emphasize shortness.
(2). Vertical panels will slenderize the figure if they are smaller at the waistline than shoulder or hipline.

XIV. Each girl in class was asked to select one illustration of a girl wearing garments attractive for one of the figure types. She was then to select another illustration of a girl wearing garments unattractive for this figure.

Pat chose the short, plump figure type and these are the illustrations she plans to use.

Which dress should be labeled "more attractive for a short, plump girl?"

A B

Check (x) the better choice for this figure type

___ 1. Figure A
x 2. Figure B

Check (x) the reason(s) that explains your choice.

___ 1. A dropped waistline would give her a longer look
x 2. The vertical lines will slenderize the figure.
x 3. A small belt will call less attention to her waistline than the fitted waistline.
x 4. The pleat which tapers toward the waistline will slenderize the figure.
___ 5. A will conceal her stomach better than B.
___ 6. The straight skirt will be more slenderizing than the skirt with the big pleat.

Generalization S: Fabric textures can reveal, increase, or camouflage the natural lines of your figure and make you appear more nearly the size you want to be.

(1). Stiff, crisp, or bulky fabrics increase or build out the figure.
(2). Soft, clinging fabrics reveal the figure.

XV. Buying a dress presents problems for Valerie. Being thin, she wants a dress that will not emphasize her thinness. She has found three dresses that she likes and all are similarly styled. One is corduroy, another jersey, and the third is taffeta.

Check (x) the fabric that is <u>least</u> suitable for Valerie, using texture as the basis for your choice.

____A. Corduroy
_x_B. Jersey
____C. Taffeta

Check (x) the reasons that explain why these fabrics would be good or poor choices for Valerie.

_x_1. Bulky fabrics build out the figure.
_x_2. Soft, clinging, fabrics reveal the figure.
_x_3. Corduroy will make her seam larger because it is bulky.
____4. Corduroy would stay close to her body and emphasize her thinness.
_x_5. Crisp fabrics would make her look heavier because they would stand out more than soft, clinging fabrics.
____6. Crisp fabrics emphasize her shape.

Generalization T: Colors with a quantity of red or yellow, unless greyed, tend to be warm. Colors with a quantity of blue, particularly if they are middle value, tend to be cool.

XVI. Barbara is selecting a play suit that she can wear next summer. Her mother has suggested that she choose a color that is cool. She has found two at the same price that she likes. Both suits would be equally becoming to Barbara.

Which of the two colors shown on the Bulletin Board* would be the better choice for summer?

Check (x) the color that is better for Barbara to choose for summer.

x A. Blue
___ B. Yellow

Check (x) the reason(s) that explain(s) your choice.

x 1. This blue is a cool color
___ 2. Yellow is a brighter color than blue
___ 3. Yellow is a cool color
___ 4. Darker colors are cooler than light ones

Description of illustrative material needed.

Color illustrations for this and subsequent test items requiring color illustrations may be made from outdated paint chips or wallpaper swatches that might be supplied by your local dealer or from swatches of plain fabrics.

The two illustrations to be displayed on the Bulletin Board for this test item should be a cool blue designated as A and a warm yellow designated as B.

Generalization U: Warm colors are usually becoming to the warm type and cool colors to the cool type.

XVII. Mrs. BcBride has a rose colored sweater that she wants to give to one of her nieces. Carolyn has peach colored skin, brown hair, and brown eyes. Kay is very fair, has blue-black hair, and blue eyes. The rose sweater would be a better gift for which girl?

Check (x) the name of the girl for which the rose sweater will be a better choice.

x A. Carolyn
___B. Kay

Check (x) the reason(s) that explains your choice.

____1. Kay's coloring is the warm type
____2. Rose blends better with black hair than brown
____3. Warm colors are usually becoming to people with cool coloring.
x 4. Carolyn's coloring is the warm type.
____5. Kay needs to wear bright colors that will bring out the color of her complexion.
____6. Carolyn's coloring is the cool type.
x 7. Warm colors are usually becoming to people with warm coloring.
x 8. Rose blends better with brown eyes than blue
____9. Rose blends with fair skin better than peach colored skin.

Generalization V: A feature can be accented by wearing colors that repeat or contrast the color or value of the feature.

W: Becoming colors are those which give your complexion a natural, healthy appearance.

XVIII. After receiving an invitation to the school party, Dana has begun to think about what color she would like to have for her new dress. When buying clothing, Dana has to keep in mind that she has a sallow complexion (contains yellow). In the local store there are two dresses, one yellow and the other rose, that she likes. Which of the two colors shown on the Bulletin Board* would be a better choice for Dana?

Check (x) the color that is better for Dana.

____A. Yellow
_x_B. Rose

Check (x) the reason(s) below that explains your choice.

____1. Yellow will brighten her complexionl
____2. Light colors look best on people with sallow complexion.
____3. Darker colors will bring out the color of her complexion.
____4. Yellow will avoid emphasizing the rose in her complexion.
_x_5. Rose will bring out the pink in her skin.
____6. Darker colors look best on people with sallow complexionx.

Description of illustrative material needed.

The two illustrations to be displayed on the Bulletin Board: A pale yellow designated as A and a rose designated as B. See suggestion on Item XVI.

Generalization X: Specific combinations of color may be identified by their proper names.

(1). A monochromatic color harmony is composed of different values and intensities of the same color
(2). An analogous color harmony is composed of related colors lying next to each other on the color wheel. Because related colors create a blended effect, they combine harmoniously together.
(3). Colors included in a complementary scheme come from opposite sides of the color wheel.
(4). A triad color harmony is composed of colors which, when joined, form an equilateral triangle on the color wheel.

XIX. In the blank at the left of each color harmony place the number of the color combination shown on the Bulletin Board* that it illustrates.

	Color combination	
4	A. Monochromatic	7
3	B. Complementary	3
1	C. Triad	1
2	D. Analogous	4

Listed below are descriptions of color combinations. In the blank at the right of each color harmony place the number of the description below which fits it best.

Descriptions of color combinations

1. Colors, which, when joined, form an equilateral (equal-sided) triangle on the color wheel.
2. Only the three primary colors
